As an English woman of family and position, she was intensely interested in the political relations of England in the East and in the attitude of the Turkish Government and the Syrian peoples toward England. Travelling while the Japanese were winning their victories over Russia, she found, somewhat to her surprise, that the news of the war and of those victories had penetrated even to the most remote and unexpected regions of the Hauran and the Arabic desert. To them the victory of Japan meant a victory of Asia over Europe and awakened in each and all a new sense of national and racial pride. The Druzes even believed that the Japanese belong to their race, basing that belief on an alleged secret doctrine "that some day an army of Druzes will burst out of the furthest limits of Asia and conquer the world." On the whole, however, this awakening of the Asiatic and anti-European spirit did not redound altogether to the disadvantage of the English. The bulk of the Christians in Turkey have always turned to Russia for help, and so now in the Christian churches masses were said, prayers offered, and penance done for the Russians. England's sympathies, on the other hand, have always been counted as against the Christians in the East. Moreover, England is Japan's friend and ally, therefore the victory of Asia over Russia was to that extent beneficial to the prestige of England.

The conversations with all sorts of people which Miss Bell, as it were, phonographs, are delightful, and some of them are as apt for the West as for the East:

"Look you, your Excellencies," said a man who was making coffee over the brazier, "there is no religion in the towns as there is in country places."

"Yes," pursued Milhēm.

"May God make it Yes upon you!" ejaculated the Kurd.

"May God requite you, oh Agha! You may find men in the Great Mosque at Damascus at the Friday prayers and a few perhaps at Jerusalem, but in Beyrout and in Smyrna the mosques are empty and the churches are empty. There is no religion any more."

"My friends," said the Agha, "I will tell you the reason. In the country men are poor and they want much. Of whom should they ask it but of God? There is none other that is compassionate to the poor save He alone. But in the towns they are rich they have got all they desire, and why should they pray to God if they want nothing? The lady laughs—is it not so among her own people?"

I confessed that there was very little difference in this matter between Europe and Asia, and presently left the party to pursue their coffee drinking and their conversation without me. (P. 99.)

Here is a delightful bit of philosophy regarding the effect of wealth when unrestrained by law. After dining with a certain wealthy Agha, whose own language and conduct, confirming the reputation given him by others, showed him to be capable of any outrage and extortion upon his poorer neighbors, Miss Bell said to her servant: "Oh, Mikhāil! I have travelled much in your country, and I have seen and known many people, and seldom have I met a poor man whom I would not choose for a friend nor a rich man whom I would not shun. Now how is this? Does wealth change the very heart in Syria? For, look you, in my country not all the powerful are virtuous, but neither are they all rogues." To which he responds: "Oh, lady, the heart is the same, but in your country the Government is just and strong and every one of the English must obey it, even the rich; whereas with us there is no justice, but the big man eats the little, and the little man eats the less, and the Government eats all alike. And we all suffer after our kind and cry out to God to help us since we cannot help ourselves" (p. 318).

It is not easy to criticise a book like this, so full of delightful passages and descriptions which lose their charm unless told in the words of the writer. One's inclination is to do nothing but hang together a string of quotations. Far better is it to say: Go and read the book for yourself. I cannot quote it all and unless all is quoted you have lost the better part.

The Rise and Decline of the Netherlands: A Political and Economic History and a Study in Practical Statesmanship. By J. Ellis Barker. New York: E. P. Dutton & Co. $3.50 net.

"The history of the Netherlands is a history of missed opportunities and of opportunities deliberately thrown away."

To prove this thesis and to make it a warning to Great Britain, Mr. Barker sketches the experiences of the ancient countships as they were aggregated under one sovereign, as they passed under Spanish rule, and out again into a confederation. Then he proceeds to discuss the policy pursued in the administration of the seven provinces known as "The United Netherlands" during the period of their greatest prosperity in the seventeenth century. The writer is, first and last, a special pleader. His aim is to point a moral and to prove that a decline of British prestige is inevitable unless the fatal errors committed by her neighbor, the Dutch commonwealth, be avoided. For that neighbor, he maintains, deliberately sacrificed a world-wide dominion by yielding to petty provincial considerations fostered by commercial politicians. The tale is adorned by a bewildering array of quotations. Fragments from Thucydides, Machiavelli, Ecclesiastes, Schiller, Sadi, and a host besides, ancient and modern, are brandished like torches to illumine the argument, while Netherland authorities without end are cited to show the bases whereon the premises rest.

Now the general conclusion that provincial self-interest overbalances the claims of a larger policy in the Dutch confederation is true, but the historic facts as Mr. Barker uses them for his deductions are sometimes incorrectly conceived, or at least badly stated. For example: In a comparison between Magna Charta and the Great Privilege wrested from Mary of Burgundy in 1477 occurs this sentence: "The Dutch charter *strips* the sovereign of the power of the purse, of the law, and of the sword." There was, indeed, a change in regard to the law as some centralizing measures had been taken before 1477. But there was no change in the purse. The sovereign could not be "stripped" of what he had never possessed for a moment. No Count of Holland had been able to assess his subjects for a cent. Charles the Bold, whose death in 1477 was followed by this Charter, had indeed asked for larger *aids* from the towns than any of his predecessors had ever dared demand, but it was a request only, and granted in part with severe criticism from the sovereign purse-holders.

In another instance the writer's bias seriously affects the presentation he gives of the facts. The contest between William II. and the burghers, in 1650, is described under color of the conviction that the former was a "gifted and high spirited youth, a born ruler of men," who would have maintained the nation's proud position in Europe, while the burghers were "intriguing politicians of the Little Holland party." Now, just before this young stadtholder's death he was engaged in an attempt to control the municipal elections of Amsterdam, and to put in officials of his own se-

lection. That the "self-assertive burgher politicians" were justified in resisting such infringement of their civic rights may, at least, be considered an open question. The crisis might be charged to William's failure to see that respect for local government lay at the bottom of the central authority he hoped to wield. His action gives reason for doubting his ability. But the "strong man" is Mr. Barker's solution for all difficulties. His distrust of party rule, which he counts an injurious self-seeking rule, goes so far that the central power in the hands of a vigorous personality seems to him the only government making for the welfare of a nation.

Possibly there may be some useful suggestions to British statesmen in this fervent plea for a unified nation in lieu of the loosely hung together British empire. A political pamphlet may be forgiven for faults that mar a book as a piece of literature. From an artistic as well as from an historic point of view there are very grave defects in Mr. Barker's volume. Petty inconsistencies in reasoning, repetitions of statement, and above all the over-abundance of citation, all combine to make it tiresome reading.

Science.

The Warblers of North America. By Frank M. Chapman. New York: D. Appleton & Co. $3 net.

We have had many books on the birds of the United States and even on restricted portions of the country, but this is the first untechnical monograph on any single group of American birds. The wood warblers, or *mniotiltidæ*, comprise a typically New World group, extending from Alaska to Argentina and numbering some 155 species. Of these, fifty-five are found north of Mexico; and it is of these, with their nineteen additional subspecies, that this volume treats. Direct comparison may be made with Bendire's unfinished "Life Histories"; and like that work, this of Mr. Chapman's is avowedly a compilation. As the value of Bendire has not been lessened in the fifteen years since publication, so the warbler volume bids fair to remain an authority for a long time.

No keys to species are given, for the excellent reason that every species in male, female, and often in young plumage, is represented in color plates by Fuertes and Horsfall, 124 figures in all, excellent both as to drawing and color. These plates and the migration tables have already appeared in *Bird Lore* during the last three years. A plan of the work and a list of the thirty-six principal contributors precedes a chapter on the generalities of the subject. Here we find sub-headings on the plumage, distribution, songs, nesting habits, and mortality by Chapman; migration by W. W. Cooke, and food by E. H. Forbush. Among the contributions to the main part of the book, Gerald Thayer's notes on songs and habits are especially valuable In the discussion of plumage, the mention of the indications of common ancestry betrayed by the nestling types of coloration is of considerable importance, as are also the suggestions as to the probable origin of each genus.

Following this comes the special treatment of the warbler family, each species and subspecies being taken up in turn. The method of presentation is as follows: the genus *mniotilda*, for example, is defined as to its generic characteristics, while its single species *varia*—the black and white warbler—is figured on the opposite page. Of this species we are then given the distinguishing characteristics and the plumage of young and adult in spring and fall, the general distribution, summer and winter range, and the spring and fall migrations. Two pages follow on the bird and its haunts and song; and finally short paragraphs on the nesting site, nest, eggs, and nesting date. A list of bibliographical references rounds out the treatment in a way which leaves nothing to be desired.

The nomenclature followed is that of Ridgway's "Birds of North and Middle America"—the most logical and all-sufficient which has yet been evolved. This gives a trinomial name to each form which is split up into subspecies. It has been proved that the original Maryland yellow-throat did not come from Maryland; so this long-cherished name appears only as an atavism in the colored plate, and as a cross-reference in the index. We must now speak of our familiar bird as the northern yellow-throat, or use its scientific equivalent in a score and a half of letters.

Mr. Chapman's thorough knowledge of the group, together with the free use of the results of co-workers, has given us in a form easy to consult, practically all that we know about the northern species of *mniotiltidæ*. To the technical ornithologist, as well as to the amateur with only the myrtle and yellow warblers on his "list," this volume will be of constant use.

The average chemist knows comparatively little about the technique of the nitro-compounds which have revolutionized modern warfare, but this is not altogether his fault. Each government jealously guards the secret of the composition and manufacture of its own smokeless powders, and boasts of its knowledge of all the others. No handbook on this subject, therefore, can be as complete and satisfactory as in other industries, but P. Gerald Sanford's "Nitro-Explosives" (D. Van Nostrand Co.) comes as near to this as can properly be expected. For ten years it has been a standard authority, and now is revised and brought up to date. It describes the processes of manufacture of nitro-glycerine, dynamite, gun-cotton, picrates, and fulminates, and gives the methods of analyzing them and testing their strength.

The death is announced, in his sixty-fifth year, of Hugo Magnus, professor of diseases of the eye at the University of Breslau. Professor Magnus had written a number of books in his *Fach*, and also on more general topics, such as "Aberglaube in der Medizin," "Geschichte der Medizin," etc.

Drama.

THE PARIS THEATRICAL SEASON.

PARIS, April 23.

The successes of the Paris theatrical season have emphasized certain innate tendencies of French letters and Parisian life.

The first is the universal delight in spoken verse, provided the lines are sprightly and understood without the slightest effort. The unexampled success of Rostand's "Cyrano de Bergerac" was due largely to the setting of whimsical, sympathetic emotions in such verse. Catulle Mendès's "Sainte-Thérèse" at the beginning of the season had wonderful versification, but the thought was too fantastic and subtle for more than a moderate success. But the "Bouffons" of Miguel Zamacoïs, which follows in the same theatre (Sarah Bernhardt's), has passed its 100th representation, and may continue endlessly like "Cyrano" and, at the Opéra, Gounod's "Faust." The fate of the piece, without verse and without Sarah, is to be tested in America; and the story and brisk dialogue will speak for themselves. But there can be no doubt that the superb versifying doubles the effect in French. People who do not like to take their art pleasures sadly should rejoice at this revival of popular poetry of a high quality on the French stage. It comes at a time when French book poetry is at a low ebb. Possibly the dramatic art may give rise to a whole generation of poets, whose work will enter into the classic treasure of the French people, just as the plays of Corneille and Racine are now the great French poems.

Rostand and Zamacoïs have begun a movement of verse quite outside of all critical or æsthetic schools, and their success has not been with those who ask if it is the fashion to applaud before they let themselves go in frank admiration. It is a sort of Régence style of poetry for the delight of novel and magazine readers. All literature is now inevitably subject to the likes and dislikes of this class; but French poets, with the doubtful exception of François Coppée, had not been willing to recognize it.

The new piece of Jacques Richepin—"La Marjolaine," just brought out at the Porte-Saint-Martin Theatre—is a good example of the new movement, which tries to satisfy the exacting desire of Parisians for really good plays, while contenting the passion of all Frenchmen for lucid, lilting, lively verse spoken naturally and with spirit. The young author is son of Jean Richepin, whose verse is the stateliest measure heard in France since Victor Hugo; but the father's plays, such as the "Chemineau," were too sonorous, too scintillant of high poesy, just as Catulle Mendès is too precious for the public of to-day. It is a public immensely larger than any of the old time, and reading immensely more and conversant with more things, but far less cultivated in thought, far more mediocre in the level of its refinement. Marjolaine is the child of a miller's daughter and a grand seigneur under the old régime. It is a character fitted to spout verse for Republicans who love to think of their grandfathers as either Revolutionists or Crusaders, or a mixture of both.

Paysanne et noble à la fois: c'est Marjolaine.

The piece mixes the pleasures of the Regent with the prophecies of Rousseau; the lover goes to the Bastille and Marjolaine

dles, not without first having her say in this melodious verse. Defects in the piece may hinder its having the success of its predecessors; but it is another example of an interesting dramatic movement, which may prove vital in French poetry.

A second tendency which has grown in the French people with their troubles is a wandering, half-conscious comparison of themselves with what they think the rest of the world must be. This year Americans are caught by the object-glass. Of ourselves as others see us Americans are not fair judges. In Réjane's "Paris-New York," our women who come to sweep everything before them certainly do not shine, at least with those who would wish the puritan honor of our early history to slide down the grooves of time a little less rapidly. When the British author of "Charley's Aunt" looked on at its representation in French, the black clouds gathering on his face threatened thunderous discharge, although the whole house around him was screaming with joy. Alas! the pleasure was not at his fun, but at a rich and strange sea change which had come over it in crossing the Channel. So we Americans have mixed emotions when we find out how we impress the risibilities of the foreigner. "Who knows if the truth is not sad?" said Renan of the whole play of life.

"La Française" of Brieux also has its American, but he is a man and not far from ridiculous. Being in France, he feels obliged to do what he has been told everyone else is doing, until the heroine—typical "Frenchwoman"—puts him in his place. It is well meant by this very sober, serious author, who wishes only to give a good blow in defence of the fair name of his countrywomen. One of the things which made the judicious John Stuart Mill impatient was to hear Englishmen (and Americans) speak lightly of the honor of Frenchwomen; he knew the people as they are in their intense family life from his youth, when he was bred among them, to his death in the midst of them. Brieux's Bartlett, rich "gentleman farmer from Ohio," may seem to us not quite like ourselves; and most certainly, as Émile Faguet says, he pays court to ladies very much as a bear might waltz; but he takes his lesson mildly. The hero is an Americanized Frenchman, who puts everything deftly in place—which is, after all, vastly to our credit. And the earnest desire of the author to protest against the ill-fame earned for his own people by a small class of novel and play-writers is worthy of all reverence and praise. Whether this small class writes only for foreign consumption, as M. Brieux wishes us to believe, is another question, which in no wise affects the good name of Frenchmen and Frenchwomen in general. It has been remarked that Americans also have not been taken as samples of plain living and high thinking by the present French republic as they were in the republic of 1848. Do we, too, need a new literature to let the world know what we are? Our plays, at any rate, are unknown in France.

The third tendency is the reaction of the French race against the divorce evil. Play after play deals with the subject. Before divorce became easy, it was always the wife's tragedy which held the boards. Now it is the direr tragedy of the child, defenceless, and torn asunder by the conflicting passions of adult parents who have not the sense or self-control to unite in his interest. French society is strong and resists constantly all political and social revolutions precisely because of this one thing —the centring of the family in the child. French mothers have always been the strength of the French race at home, its weakness abroad, whither they are unwilling to look. "Les deux Madame Delauze" of Madame Gabriel Mourey at Réjane's Theatre is only a distorted sample.

S. D.

The first production of Julia Marlowe and E. H. Sothern, "The Sunken Bell," excited no enthusiasm in London, and the play found little comprehension. As one writer remarked, "The advantage of a symbolic play is that every one who cares can read his own meaning into it." Of the actors, Mr. Wakeley says in the *Times:* "Miss Marlowe gives the grace and elfishness and charm of Rautendelein; Mr. Sothern gives the alternate courage and despair of Heinrich. They do not, that is to say, hide the author's imagined figures from us. On the other hand, we cannot say that they give these figures a fresh and exuberant life. Miss Marlowe is not exactly a frisky fairy; Mr. Sothern's Heinrich is occasionally tame. A tame overman! What would Nietzsche say? And they are both a little too monotonous in their delivery."

"Love's Labour's Lost" was the opening play of this year's festival at Stratford-on-Avon. It was presented by R. F. Benson and his company, and showed how admirably the play, which has never been a favorite with actors, lends itself to production.

Pinero's "His House in Order," which was recently performed in Venice, has been accepted by the Vaudeville Theatre of Paris. This will be the third of Pinero's plays to be given in Paris. The first was "The Magistrate," at the Théâtre Cluny; the other, "The Second Mrs. Tanqueray," which was played sixty times at the Odéon during the season of 1904.

"The Christian Pilgrim" is the title selected for Henrietta Crosman's version of "The Pilgrim's Progress" to be produced next fall.

Two new plays have been given at the Abbey Theatre in Dublin. One was "The Eyes of the Blind," the first dramatic attempt of Miss K. Letts, a tragic piece said to have been successful. The other was "Fand," based on an episode in the Cuchullin cycle by Wilfrid Scawen Blunt.

Music.

Familienbriefe von Richard Wagner. Berlin: Alexander Duncker.

The attacks on Richard Wagner's works which were in fashion during his lifetime gradually grew less virulent after his death, and to-day they have ceased altogether. When his enemies found they could not curb the ever-increasing popularity of his operas, they sought consolation in the vilification of his personality; but this, too, received a serious check when his private letters to Liszt, Uhlig, Fischer, Heine, and other friends were published, revealing a character by no means flawless, yet ruled by principles of conduct so much more exalted, uncommercial, and self-sacrificing than those which guide most mortals that no unprejudiced reader could withhold his esteem. The deepest insight into his soul was given in the letters to his inspirer and patroness, Mathilde Wesendonck, which appeared three years ago; and now we have a volume of 124 more *intime* letters, addressed to his mother and other relatives, and brimful of interesting details. They indicate that in his family affection he was no less ardent than in his friendships and in his music.

In offering this collection, the editor, C. F. Glasenapp (the fifth volume of whose Life of Wagner is soon to appear), explains that it is by no means complete. Of Wagner's letters to his first wife only seven have been included, because it is intended to issue them all later in a separate volume. The earliest of the letters in the present collection is dated 1832, the latest 1874. In 1832 Wagner was only nineteen years old, yet already he is able to boast to his sister Ottilie of various achievements. He admits, with deep regret, that for a time, while he was with the students, he led a dissolute life, but that now he has become a man, and has plauted his foot firmly on what is to be his territory. He was aided in this by Weinlig, "the greatest living contrapuntist," concerning whom he writes:

> How much he loves me you may infer from this: that when mother asked him, after he had taught me half a year, how much she owed him, he answered that, in consideration of the pleasure it had given him to instruct me, it would not be proper to accept payment—that my industry and the hopes he had of me were sufficient payment.

In these hopes the eminent contrapuntist soon saw himself confirmed, for ere he reached his twentieth year, Richard had composed an overture to "King Enzio" which was played in the theatre every night. He had also composed a sonata for piano which was promptly published by Breitkopf & Härtel, and for which he received music scores to the value of fifteen dollars. But he was particularly proud of the performance of an overture of his at the "Grosse Konzert," a great honor, as he explains to his sister, because at these concerts they played only pieces endorsed by all the experts. And what was more, whereas, shortly before, the public had heard overtures by Marschner and Lindpainter without moving a hand, his own overture was applauded as if it had been a masterwork. "I cannot describe my feelings, and Luise was so moved that she wept."

A letter of the following year addressed to his sister, Rosalie, contains remarks on an opera by Marschner and its interpreters, which shows an astounding critical acumen for one of his age. There is, however, very little criticism in these letters, the only other specimen being on p. 144, where Jenny Lind is disposed of in rather uncomplimentary fashion:

> The "Don Juan" performance bored me greatly; but then Donna Anna is said not to be the best of Lind's rôles. Extraordinarily beautiful was her singing of the

last aria, but for the first act she lacks a great deal. She is a strange, wistful individuality, very interesting for her own sake, but not equal to the task of presenting a grand dramatic development.

By far the largest number of letters in this volume are addressed to the Avenarius family. Eduard Avenarius married Cäcilie Geyer, Wagner's stepsister, or perhaps his sister; there are several references to "unser Vater Geyer," and on p. 277 Wagner writes: "To me it seems as if our father Geyer, by his self-sacrifice in behalf of the whole family, thought he was making amends for a misdeed." There are other reasons for believing that Richard Wagner's name should have remained what it was while he was in school—Richard Geyer. However that may be, Cäcilie was his favorite sister. Her husband was a bookseller in Paris, and they saw much of him during his three years' sojourn there. Of the hard times he and his wife endured some new and harrowing details are to be found in these pages. The pawnbroker more than once was the last refuge. Whenever he departed from a town he left a long trail of debts. It must be admitted that he tried hard to make money, and was shamefully underpaid for what he did. At one time he found out that Schlesinger, who had engaged him to make arrangements of operatic scores and other things, paid him considerably less than his other assistants. In Dresden the eminent prima donna, Frau Devrient, lent him 1,000 thaler to enable him to pay his Paris debts. This ought not to have been necessary; his "Rienzi had proved the greatest financial success ever known at the Dresden Opera, yet the intendant offered him an honorarium of 300 thalers, when everybody thought he would get at least 2,000. The publishers, too, did not treat him fairly; at least he suspected they did not, and gives his reasons (p. 238). To nearly the end of his life he remained usually what he called himself, in 1842: "Hans ohne Geld."

Notwithstanding their disagreeable experiences in Paris, his wife had become so attached to that city that, as he afterward wrote from Berlin, "Minna actually hopes I may fare badly here, so that I may make a new contract with Schlesinger and return to Paris. The poor woman thinks of nothing but Paris." An earlier letter to his wife, which contains vivid reminiscences of their trip to France on a sailing vessel, includes a detail which is new and touching: "When storm and danger were at their worst, when you saw before yourself, by way of reward for all that you had suffered with me, a horrible death, you only begged me to clasp you tight in my arms, so we might not sink separated." Several of the letters of subsequent years detail the gradual estrangement and the separation caused by Minna's furious and implacable jealousy; but there is nothing new to add to the exhaustive treatment of this subject in Mr. W. A. Ellis's introduction to the English version of the Wesendonck letters. To the end of her life, Wagner kept his first wife supplied with all the comforts of life, sometimes when he lacked them for himself.

There is an interesting allusion to his most important literary work, which is still withheld from the public: "You would be able to judge me correctly," he writes to his sister Clara Wolfram, "if you could be here on the evenings when I dictate my autobiography, and my past life unfolds itself before me with astonishing vividness and distinctness. . . . Often I am deeply affected by this review of my career." There is also fresh evidence as to the high opinion he had of his Nibelung poems. He wanted them printed and judged as poems, and not merely as opera texts—rather inconsistently, for, just as he wanted his music to be heard only in connection with the poem, the action, and scenic surroundings, so he ought to have insisted that the poems lost much of their *raison d'être* and force when divorced from the music. Most of the adverse opinions on Wagner's plays were based on a disregard of this plain truth, an error thus fostered by himself.

Sixty-four years ago thirty men in Vienna met and founded a singing society, under the name of Wiener Männergesangverein. It soon grew apace, and won fame for its finished art. Eminent composers like Mendelssohn, Liszt, Wagner, Bruckner, Brahms, and Johann Strauss were proud to be honorary members. At the present day the Choir numbers 380 active members; it includes representatives of all social classes, but the well-to-do predominate to such an extent that it has been called the millionaire club. Its concerts are always given for charity, and as a result $120,000 has been distributed where it would do most good. Wealthy members have also contributed the means for a number of trips to other cities. London was visited last year, and a few weeks ago a vessel was specially chartered to bring the Choir and its friends to America. It gave a concert on Tuesday night at Carnegie Hall and will give another to-night. The tickets were all sold a week in advance; the proceeds go to local charities. At the first concert the Choir had the assistance of a part of the Philharmonic Orchestra, which was founded a year after it. The conductors were Eduard Kremser and Richard Heuberger, both of them famed as composers. They were represented on the programme and were most cordially applauded. Heuberger is a great Schubert apostle, and so it was natural that that composer should be represented by two of his works. There were also folk-songs, serious and comic, the Pilgrims' chorus from "Tannhäuser," and a vocal Strauss waltz. In the rendering of all these things, the singers displayed a precision of attack, a distinctness of enunciation, a refinement of shading, that were exemplary, and fully justified the reputation of this society as the leading male choir in the world.

It is our opinion that the best operatic work by far ever written in England is Stanford's "Shamus O'Brien," with its delightful Irish music. This opera has at last found its way to Germany. It was performed at Breslau on April 12 with such success that the curtain had to be raised no fewer than twenty times in the course of the evening.

Franz Kneisel, who was invited to take the conductorship of the Philadelphia Orchestra, has decided to remain in New York and not to abandon the famous Quartet.

Art.

THE WATER-COLOR SOCIETY.

There is a lingering tradition that water-color painting is a slighter and easier art than that of painting in oils; indeed, it used not to be called painting, but drawing. In such an exhibition as that now open at the Fine Arts building, one feels that the only remaining justification for such a notion is in the prices asked, and even this distinction is vanishing, as there is no reason it should not. Many of the artists are asking as much for their work in this medium as they would for a work in oils of similar size and importance, and why not? The method is at least equally laborious, the result quite as permanent, and, very often, more beautiful. The disappearance of the white mount is symptomatic. It is not to be seen in the present exhibition save, in one or two instances, in the rooms devoted to illustration, and in the gallery of etchings. The two large galleries, devoted entirely to work in color, are an unbroken expanse of gold mounts, while many of the more important pictures are framed exactly as oil paintings might be, in heavy gilded mouldings. By various methods of handling, such as the sponging and rewashing of the Dutchmen, or by the increasing use of body color, water-color painting has been given a consistency and substantiality approaching that of work in oils, and the slightly tinted drawing, that used to go with the white mount, has disappeared.

Indeed, there is some danger that in emulating the solidity and fulness of oil painting the peculiar advantages of water-color, its clarity and sparkle and purity of tint, may be too much sacrificed. There is nothing here, unfortunately, by two of our elder masters who have been wont to show us what the pure wash can accomplish: we miss the powerful directness of Winslow Homer, who can be more solid and luminous than any one with the fewest touches crisply laid on his white paper, and the full glow of La Farge, who is never more the colorist than in his work in what used to be called "the inferior medium." For such work the woolliness of much rubbed surfaces and the semi-opacity of gouache are poor equivalents. But water-color remains, on the whole, a transparent medium, or at least a translucent one, and the muddy heaviness and lifelessness of so much of our modern oil painting is, fortunately, impossible to it. Even the boldest use of body color cannot emulate the obstructive masses of dead material so common in oil. The result of this impossibility is a pervading sense of color in this exhibition which is in refreshing contrast to our other exhibitions. A modern exhibition of oil paintings may contain a few pieces of real color, a number of not disagreeable bits of tone, but the greater part of the works in it will look like disguised black and white. Here the impression, as one looks around the walls, is that everything is doue in color. It may be bright or low toned, full or very gray, but it is color—even pure black looks like color when it is laid transparently over a white ground.

The difference is not in the gifts or training of the painters, and our water-colorists

are not greater artists than our painters in oil. They are largely the same men. One may look over the list of members of the Water Color Society without finding half a dozen names of men specially known as painters in water-color. The others are the men who fill our exhibitions with oil paintings; yet man after man of them is here seen at his best, and shows an unexpected gift for color.

A dozen instances could be found as easily as one. Mr. Reuterdahl, for instance, is a vigorous personality, an illustrator of great dash, but nothing in the dully or violently colored canvases he has exhibited would lead one to expect such a lovely bouquet of hues as his Finish of the Yacht Race. Mr. Charles Warren Eaton has painted many pictures of dark pines against yellow evening skies, but never, in oils, with the transparent luminosity of his water-colors. Mrs. Coman has, within the last year or two, shown several charming canvases in the vein of her tiny picture here, but never has her blue mist been so tender or her sunlight so softly glowing. It is especially in blue, that tormenting problem for the painter in oils, that many of these water-colors excel. It is certain that Mr. Will S. Robinson would find it hard to match, in oils, the limpid color of the water in his Boat Landing, or Mr. Palmer to equal the faint crisp tones of the shadows on the snow in his Last Rays.

Is water-color painting, after all, an easier art than painting in oil, that so many succeed better at it? It is, at least, an art better understood. The most precious qualities of color are largely dependent on transparency. A blue pigment laid thinly over white is an entirely different thing from the same pigment mixed with white. You cannot mix a hue of rose or gold or purple that shall have the vibrant richness or the dainty purity of the same tone got by transparent washes. The painters in oil used to understand this—some of them still do—and there were technical methods based upon it and pictures produced that were colored. But our radically vicious modern education, with its insistence upon "direct painting" and "solid color," has demoralized the art and left most of us floundering in mud. The impressionists tried to pull us out, but they had more knowledge of the modern theory of light than of the ancient practice of painting, and they failed. Apparently we are now slipped back deeper than ever. The water-color painters, almost alone, have not entirely lost their ancient birthright. For the most part they still use the white ground, which the oil-painters, to save labor, have abandoned, and they still use transparent color to some extent, if not altogether. We need not demand that they shall throw away their tubes of Chinese white. Opacity has its uses as well as transparency, and there is a state of semi-opaque, partially translucent, color, which is often very beautiful in water-color, as in oils.

Almost every condition and method of water-color work is shown here except, perhaps, the old English stipple, and even that is not certainly absent. The pure wash, laid sharply on the dry paper, is excellently exemplified in Mr. Prendergast's Marble Bridge with its parterre of red and pink parasols, in Mr. Philip R. Goodwin's richly colored Caribou, in Mr. Pyle's brilliantly decorative little Fishing of Thor and the Giant, translated into Japanese, and in several other pictures. The wet wash—color floated into color without any edges—is shown to advantage in Mr. Ballin's large Pastoral, full, rich, and harmonious, but with a negligence of form which is the danger of this method and of which he should beware. The Dutch manner of sponging and rubbing and rewashing is shown in many skies and landscapes, in Mr. Zeigler's Last Lover, in Alethea Platt's Nearly Tea Time, where it has given a luminosity to the window and the lighted walls which redeem an otherwise commonplace subject.

In almost all of these, and of the pictures previously mentioned, except those by the little group of painters in dry wash, there is an occasional employment of body color to pick out a light, to modify a tone, to give the milkiness of smoke, the solidity of a wall in sunlight, the pearliness of a white sail. Mr. Mora and Mr. Hassam carry its use much farther. Mr. Mora's Before the Bull Fight seems to be painted almost entirely in body color, but his material is never quite opaque, and one feels the white paper through it, giving it a clarity and brilliancy hard to emulate in oil-painting as we practise it to-day. Mr. Hassam's McTaggart's Field is certainly, his Aphrodite presumably, painted upon a warm buff or light brown paper. Over this ground he strikes a mingling of transparent, semi-transparent, and semi-opaque colors, in a multitude of separate touches, much as he handles oils, only that the surface is neeessarily less rugged. The warm undertone showing through thin white was a favorite device of the old Dutch painters in oils, and was admirably employed by Goya. Impressionism has abandoned it, along with many other traditional methods, but here it gets back in the practice in water-colors of an arch impressionist, and the result is delightful. I own to finding this smaller Aphrodite more luminous, more atmospheric, more beautiful in color, than the large painting of the same composition in the exhibition of the Carnegie Institute at Pittsburgh, though it is somewhat less happy in shape and division of space.

It is only in Mr. Hopkinson Smith's Old Groote Kirk that one reaches the ultimate condition of painting in gouache—distemper painting, such as is employed by scenic artists, rather than water-color. Even here there is some transparent washing, as in the tower, but the cold gray paper, employed for expedition's sake, deprives it of vivacity. The rest is very skilful use of quite opaque tones, the gradations got by mixture with white. Able as the work is, there is a sacrifice of the peculiar beauty of water-color, a chalky heaviness, that one regrets. It is not very sensible to find fault with clever gouache painting for not being something else, but one may hope that our water-color painters are not all to become painters in gouache.

To sum up, it is indubitable that our painters in water-color have learned much in their emulation of oil-painting. Perhaps the time has come when our painters in oil might learn something greatly to the purpose by a judicious study of the qualities of water-color.

In the small side galleries there are, besides one or two of the works already mentioned, a few monotypes, etchings in color, etc., and a number of partially colored or black and white drawings for illustrations by Abbey, Penfield, Smedley, Frank Craig, Mucha, and others, among which Olive Rush's The Lullaby Mother is especially charming. The little octagonal room is filled with a collection of etchings, varying in style from the indication by spots of Pennell to the much more linear work of Charles Henry White. Mr. White's Condemned Tenement is especially good, and is excelled, if at all, only by Ernest D. Roth's Wooden Bridge, Venice. Different from any of the other plates, less picturesque but with a fine austerity, is Everett L. Warner's Notre Dame from the Tour Dagobert.

KENYON COX.

Charles Scribner's Sons are issuing, in four volumes, the most attractive edition of "Don Quixote" now in print. There are but 1,150 copies, of which 140 are in imperial Japan paper, with extra print, before letter, of all the full-page illustrations. The text is that of Thomas Shelton, the Elizabethan translator. Many translators have tried their hands at "Don Quixote," and the reader can take his choice between a variety of styles. The successors of Shelton have had their day—John Phillips, Motteux, Jervas, and Smollett. Smollett's name has given his version an undeserved vogue, for it is probably the worst of the lot. Jervas is correct and careful, but dull and commonplace. Shelton, in spite of some archaisms, in spite of roughness and incorrectness, is more vigorous, more akin to the original, more sympathetic with the spirit of Cervantes, than any of the later translators. Thus it is that though Jervas's version is widely accepted, Shelton has been kept alive by reprint through nearly three centuries. The feature of this edition, however, is not the text, but the illustrations by the late Daniel Vierge. That Spanish artist, who passed most of his life at Paris, long cherished an ambition to illustrate "Don Quixote." Paralysis destroyed the power of his right hand, but he trained himself to use his left, and when he started upon these drawings, in 1894, he again possessed complete mastery of his pen. He finished the task only about a year before his death. In an interesting Introduction of some thirty pages, Royal Cortissoz discusses the theory of illustration and in particular the "long line of vile attempts" to illustrate "Don Quixote," from the Brussels edition of 1662 to the present day. As Mr. Cortissoz justly remarks, "'Don Quixote' was a picture-book before the first illustrator touched it, a fact which, indeed, has contributed largely to its fame." That is to say, the book is concrete and full of images. The fault of the illustrations has been that they either lack artistic merit or else they fail to give the proper background and the Spanish atmosphere. We need not traverse in detail the ground which Mr. Cortissoz has covered, and, before him, H. S. Ashbee in the "Iconography of Don Quixote." The designs of Coypel, Johan Vanderbank, Antonio Carnicero, and Joseph del Castillo, Hayman, Chodowiecki, Smirke, Westall, Corbould, Daumier, Tony Johannot George Cruikshank, and Doré all fell short in one point or another

The task was thus reserved for Vierge,

whose long apprenticeship in many kinds of illustration was but a preparation for this final achievement. Mr. Cortissoz tells of the training which resulted in that easy mastery which Vierge displays in these drawings—100 full-page and 160 others skilfully placed in the text. His love of the open road and his intimate and sympathetic knowledge of the Spanish world made him by temperament and habitat the fit interpreter of Cervantes. Add the technique which Philip Gilbert Hamerton praised so warmly and we come near to having the perfect illustrator of "Don Quixote." Vierge draws the knight as he was in body and also in soul, gaunt, battered, but always with his heart set upon the ideal—a devotion that lends to him in his worst plights a redeeming touch of melancholy dignity. And so with all the other personages in the shifting scenes of the knight's adventures. Then, too, the pictures, with their delicate and true detail, the admirable massing of light and shade, and the balance of composition, are in themselves beautiful.

Drawings and etchings by Daubigny will be shown at Frederick Keppel & Co.'s until May 11, and eighteenth-century engravings at K. J. Collins's until May 18.

George B. Butler, National Academician and well-known portrait painter, died at his home near Croton Falls, N. Y., on Saturday, in his seventieth year. Mr. Butler had passed a good deal of his life abroad, and at one time had come under the influence of Whistler. But he served in the army during the civil war, and at Gettysburg lost his right arm. He was elected to the National Academy in 1873, and his last picture was shown in the recent exhibition of the society.

Finance.

THE INJURY TO THE CROPS.

On Friday, May 10, the Government's Agricultural Department will issue the second of its important estimates of the season, on the condition of the growing crops; and in advance of that calculation, the grain trade has been trying to ascertain what the crop situation really is. It was pointed out in this column, three weeks ago, that the Government's April estimate on wheat was not unfavorable; that the "condition percentage," as of April 1, 89.9, was nearly 1 per cent. better than that of the preceding April, and was higher than in fifteen out of the twenty past years. But even before that estimate had appeared, on April 10, the grain trade was busy with reports of injury to the growing wheat. At first, these reports took the form of estimates of serious insect damage. The "green bug's" ravages, however, appeared very soon to have been much exaggerated. What assumed a more genuine place in trade calculations was the continued abnormal weather throughout the country, but particularly in the southwestern region, where the wheat was already growing. April's unseasonable cold—to which, so far as his own locality is concerned, every one can bear witness—seemed to be doing part of the mischief; a prolonged drought in the winter wheat belt was doing more. Despite considerable relief by rain in the Southwest a week ago, the grain trade's doubts continued; the price of wheat for July delivery, quoted in Chicago at 78½ cents per bushel on April 1, and at 79 on April 10, has risen this week to 85⅞.

Secretary Wilson of the Agricultural Department gave out an interview last Monday, in which he took decided ground against the pessimistic views. Advices received by him, regarding the early wheat, led him "to believe that the Southwest will have its usual crop this year." The damage by insects had, in his view, been purely local, and his conclusion was that when harvest time comes, "it will be found that all this cry of crop damage has been made for a purpose." This is at least possible. The wheat speculators, some of whom employ trained experts and keep them constantly travelling about the grain belt, doubtless learn the truth about the outlook, but it does not follow that they tell the exact facts to the general public. On the contrary, if they were speculating for the rise in wheat, on knowledge of a slightly damaged crop, it would obviously be their motive to induce other speculators to believe in much greater damage, and so persuade them to buy, at still higher figures, wheat contracts which the disseminator of the "damage reports" might then choose to sell to them.

All this is possible; yet it is only reasonable to point out that in Kansas the State Agricultural Department has already calculated the "May condition" of wheat at 84 per cent., as against 99 in the national government's April estimate for the State; that the Ohio Department fixes 74, against 83 last month, and that Missouri authorities give 82, against 96 in April. In other words, all official data thus far obtained go to show that the wheat crop's outlook has been considerably impaired during April. Compared with the estimates of a year ago this month, these State estimates are 5 to 25 per cent lower, and, although the experts do not agree as to whether or not the crop has been hurt since the "May percentages" were compiled on the first day of the month, all concede that the season, in the West as in the East, has continued so "backward" as to give little chance for betterment of the conditions existing a week or more ago.

It must, however, always be remembered that an "impaired crop outlook" is a very different thing from a "threatened crop failure." This greater catastrophe, nobody dreams of predicting. It could not be brought about, save through a kind of weather, between now and August, of which there has been as yet no indication. Unseasonable cold and damp often blight a part of this country's cereal crops, but only abnormal drought can cause crop failure. In our wheat crop, actual and general disaster of the sort has hardly happened since the famous "dry year" 1881. But the planted area under wheat in this country, sixteen years ago, was less than 38,000,000 acres; it has since then exceeded 49,000,000. With the extension of the "wheat belt" north, south, and west, under the scientific irrigation and cultivation, the crop as a whole becomes constantly less subject to the vagaries of a given section. With the present extent of our agricultural area, a summer in which, as in 1881, all the grain crops are scorched and withered, is about the most improbable of agricultural events.

BOOKS OF THE WEEK.

Bailey, H. Lavinia. By the Sea. Boston: Richard G. Badger. $1.
Blüthgen's Das Peterle von Nürnberg. Edited by Wilhelm Bernhardt. Boston: D. C. Heath & Co. 35 cents.
Brown, H. Collins. Mr. Goggles. B. W. Dodge & Co. $1.50.
Buskett, Evans W. Fire Assaying. D. Van Nostrand Co. $1.25 net.
Campbell, Douglas Houghton. A University Text-Book of Botany. Macmillan Co. $4 net.
Carlveau, Robert. Unseen Save of Solitude. Boston: Richard G. Badger. $1.50.
Carus, Paul. The Rise of Man—Chinese Life and Customs—The Story of Sansom—Chinese Thought. Chicago: Open Court Publishing Co.
Crawshaw, William H. The Making of English Literature. Boston: D. C. Heath & Co.

MAKING A NEWSPAPER
By J. L. GIVEN. The author was recently with The N.Y. Evening Sun. Just published, $1.50 net; by mail, $1.62.
"Deserves cordial praise, understands his subject, and his writing is lucid. He has advice for the novice, encouragement for the young reporter, and information for everybody interested."
—N. Y. Times Review.
HENRY HOLT & CO 29 W. 23d St. New York.

The Nation.

NEW YORK, THURSDAY, MAY 16, 1907.

The Week.

It is true that this country is always crossing Presidents before it comes to them, but the process, this year, seems to be more premature and gratuitous than ever before. Usually, the thing has been done more quietly. There would be a certain amount of newspaper thundering in the index about this or that candidate; chairmen at banquets would "have the honor of presenting to you the next President of the United States"; but the real work of shaping political forces and securing delegates would be done without advertisement or blare. The Fairbanks method is the time-honored one. But vociferous days demand something more noisy; and, accordingly, we have all these battle-cries from Ohio and the resounding action of New York Republicans, more than a year before the National Convention meets. These anticipatory alarums and excursions have their drawbacks. Battles won in advance have a way of not staying won. On Sunday, for example, the friends of Secretary Taft in Washington, including the great and good friend in the White House, were all smiles over the news from New York that the State Committee had refused to endorse Hughes for the Presidency. That left a clear track for Taft. But Monday morning brought a rude awakening. Senator Foraker kicked over the agreement which Boss Cox of Ohio was supposed to have made with his consent, to give Taft the solid Ohio delegation without a contest. The defiant Senator now declares that he will not be bound by any understanding entered into by the Taft managers and Boss Cox; that he will set at naught any deliverance in favor of Taft by the State Committee, and will carry the contest for control into the party primaries. This makes a great change. If Foraker adheres to his determination, Secretary Taft will be under the handicap, as a candidate, of having to fight for his own State. Such are the vicissitudes of a combat prematurely forced.

One reason why Gov. Hughes has been so long without the support of the politicians in his party is that he himself is not a politician. Having held no offices, trained with no organization, taken orders from no bosses; but having merely been called upon in a great emergency, as a man of brains and character, to save the State from a riotous demagogue, it was not strange that the hardened politicians of the party should look upon him with a certain amount of jealousy and dislike. If a novice like him could succeed at the first trial, what would become of the mysteries of the political profession? Some such questions must have been in the minds of those who have pityingly said that "Hughes does not know the political game," and who have stood apart to see him make a mess of it by himself, and then call upon them in despair for their indispensable aid. But it did not work that way. At present, it seems simply to be in dispute which one of the disgruntled politicians can first get to the Governor to swear fealty. The sudden turn of events in favor of Gov. Hughes is thus only one proof more that a leader who actually leads will not lack for a following. Mr. Hughes has not solely sought to ascertain public opinion; he has endeavored to shape and direct it. His speeches revealed not merely a strong man, but a good cause; and the two together still make up the greatest polltical force known.

The Merritt bill, which passed the New York State Assembly Thursday, providing for a convention of invited delegates from other States to recommend uniform legislation on utilities, divorce, and other subjects, merely embodies a movement that has been very general this year. And there have been other indications that the States are resolving to make themselves more effective in their own fields. This is due in part to an impulse to assert themselves against encroachment of Federal authority, and in part to a feeling that was growing even before Secretary Root's much-discussed speech. Undoubtedly, the State Governments had a reputation for laxity a few years ago. The ludicrous dissimilarity of their laws failed to impress itself upon the country, only because so few of these same State laws were respectably enforced. In a dozen ways they are now working toward efficient coöperation. Just what the Merritt bill's chances are in the Senate, we do not know. But, if New York does not take the lead in the movement for uniform legislation, it is certain that some other commonwealth will.

Besides its incidental vindication of the doctrine asserted by Senator Spooner, in the debates on the Rate bill, that Congress has no power, after creating a court, to limit its judicial powers, the decision of the United States Supreme Court in the Arkansas River case has most important practical bearings. Kansas virtually accused Colorado of stealing her river. Colorado was using water from the Arkansas River for productive irrigation projects, which would have been destroyed had the Court upheld to the full the Kansas contention. As it is, Justice Brewer's opinion is truly applied common-sense. Colorado must not be allowed to monopolize the water, says the Court in effect, but both States are entitled to use it exactly as if they were neighboring riparian proprietors under the jurisdiction of the same State. "Equality of right and equity between the two States forbids any interference with the present withdrawal of water in Colorado for purposes of irrigation." Justice Brewer adverts to the fact that, if Kansas could have enjoined Colorado and its citizens from abstracting water, Oklahoma, into which the Arkansas River next passes, could have taken the same action against Kansas. Such downstream tyranny has at least been averted.

For a commonwealth that everybody admits deserved Statehood years ago, Oklahoma is certainly having a good many troubles. It is now in the air that the Constitution, though it was adopted by a convention that made a record for endurance and embodies every modern improvement known to mankind, may be rejected by the President, after all. Of course it is a radical Constitution, for it has accepted the results of all the "advanced" legislative experiments made in any of the States. If that were all, it would be in little peril of rejection, since much of the experimenting of late has been done by Western Republican Governors and Legislatures. But this Oklahoma Constitution is an arrogantly Democratic instrument. The Democrats unexpectedly controlled the Constitutional Convention about as completely as if it had been assembled in Georgia or Texas. They did as they pleased with their power, and paid no attention to the conservative and succinct report of the minority. They have even gerrymandered the new State, a practice abhorrent to the party of moral ideas, and have assured an initial Democratic Legislature, in any event short of a wholesale massacre. It is this which brings the great leaders of Republicanism into conclave. They are meditating the employment of the last terrific weapon in the party arsenal—a speech by Mr. Taft. He is to address the Republican Convention next month, and if, as forecast, he gives the Democrats to understand just what will happen if they forward the Constitution to the President in its present form, the reply will surely be, "Don't fire; I'll come down."

Complete data for the movement of English and American prices in 1906 are now at hand. For England, the index number computed annually by Mr.

Sauerbeck rose from 72 to 77, or about 7 per cent.; while for this country the statistics of the Bureau of Labor show an advance from 115.9 to 122.4, an increase of 5.6 per cent. Mr. Sauerbeck's figures indicate that the rise of prices was most marked in the group of textile products, and least so in the group of food products. The tables of the Bureau of Labor show that metals and implements, lumber and building materials, with cloths and clothing, contributed most to the general upward movement. Since 1896 and 1897, when prices touched the lowest level, the movement of the index numbers in the two countries has been as follows:

Year.	England.	U.S.	Year.	England.	U.S.
1896	61	90.4	1902	69	112.9
1897	62	89.7	1903	69	113.6
1898	64	93.4	1904	70	113.0
1899	68	101.7	1905	72	115.9
1900	75	110.5	1906	77	122.4
1901	70	108.5			

Clearly enough, the reactionary tendencies which kept the general average nearly stationary from 1900 to 1904 have spent their force, and prices are now advancing with great rapidity. Since 1896, English prices have risen 26.2 per cent., while American prices have increased not less than 35.4 per cent.

Mr. Campbell's famous "New Theology" has had hard things said of it by the orthodox; now it catches a drubbing from the other extreme. In the May *Positivist Review*, Mr. Frederic Harrison pays his respects to the movement which is so mightily stirring the English churches. In it, he is not able to see anything essentially "new." He says of it that it is "almost in terms" a "revival of intellectual developments" often encountered during the past century in various communions, even within the Catholic Church; and applies to the new gospel the hard saying: "It is a more or less conscious effort to water down the popular conception and creed of Christianity into a very fluid form of Christian ethicism, and even Christian pantheism." Of course, Mr. Harrison cannot close without putting in a special plea for his own particular "religion of humanity," which is what Mr. Campbell and all his kind are, he says, dimly feeling after. Lucky for Mr. Harrison that Matthew Arnold is not still alive to attack him again on that issue! For the rest, in his zeal to confute "The New Theology" philosophically, he seems to ignore the moral and humane enthusiasm which undoubtedly burns in its votaries.

The four hundredth anniversary of the birth of Calvin occurs in the same year with the three hundred and fiftieth anniversary of the University of Geneva. It was first established as the Académie de Calvin in 1559, and became a university only in 1873, with regular faculties of theology, law, medicine, and natural science. Charles Bargeaud, one of the professors of law, published a few years ago an elaborate history of the institution, which has had on its rolls names famous in European letters and science; among them are those of De Luc, the geologist, who was a contemporary of Cuvier; Merle D'Aubigné, the historian of the Reformation, and Adrien Naville, the present professor of logic. There are now more than a thousand students at the university. A committee has been appointed to make plans for celebrating the jubilee, and to invite foreign scholars to be present. The expenses are to be met—at least partly—by the proceeds of a fair to be held next year under the auspices of the leading women of Geneva. The festival itself will recall the intellectual and revolutionary history of the Swiss metropolis in earlier times. "To every nation in danger," says Michelet, "Sparta sent, instead of an army, a Spartan. So it has been with Geneva. To England she gave Peter the Martyr; to Scotland, Knox; to the Netherlands, Marnix—three men and three revolutions."

Too much importance can easily be attached to the "soul-history" of a professional *littérateur* like Joris Karl Huysmans, who has just died at Paris. He began his career as a crass realist, he ended in mediæval mysticism, and on the way passed through various philosophical and emotional vagaries which it has been habitual to characterize as steps in a consistent evolutionary process. How sincere were Huysmans's successive conversions? If sincere, in the ordinary sense of the word, how indicative of actual change beneath the falling and swell of the literary emotional surface? The fact that Huysmans passed from extreme naturalism to extreme supernaturalism may mean only a taste and capacity for dealing with primary colors and strong lights, such as is by no means uncommon among Huysmans's compatriots. Ludovic Halévy is the author of probably the most widely accepted text-book idyl in the world, "L'Abbé Constantin," though in his Offenbachian librettos and elsewhere he has shown that he by no means lacked the Attic salt. Zola himself, Huysmans's first master, has written beautiful idyls. The gifted French author, with his talent, is like the small boy with his new jack-knife: not at all averse to show how many different things it can cut. When he's horrid, as he likes to be so often, he's very, very horrid; but when he's good, he can very often beat the sentimentalists at their own game. But in so doing he does not avoid the sense of the false note to be found in Théophile Gautier when he protests his equal susceptibility to the beauty of Venus Anadyomene and of the Virgin.

So far as the Hague Conference itself is concerned, we can only commend Mr. Root's insistence upon a discussion of the question of disarmament. The Conference bids fair to be timid enough; if it is afraid even to talk about the limitation of armies and navies, it is likely to become the laughing stock of diplomatists the world over. It matters not that Germany has announced that her delegates will not participate in such a discussion. Von Bülow has left a loophole by saying that, if the rest of the nations make some practical suggestion, Germany will promptly consider it. Now, the Chancellor should be taken at his word; the energies of the American and British delegates should be directed to finding some plan which the Germans will be compelled to consider. The British Government has shown its good faith by a limitation of its naval programme—subject to the action of the Conference. If the American delegates assume an active leadership in this matter, England will surely fall in line. It would be a great misfortune if, in deference to Von Bülow's utterances, Campbell-Bannerman should permit the question to drop. As Mr. Root says, even if there were no direct practical results from such a discussion of the limitation of armaments, the mere canvassing of the subject might still be a long step in the direction of peace.

We have frequently pointed out how quietly and steadily the army is year by year increased. Almost every session of Congress since 1898 has seen some addition to the military force. This winter it was the artillery which benefited enormously, and many officers now transferring to that branch of the service, to take advantage of the rapid promotion, are doing so because they believe that the coast artillery will be periodically increased. It is so easy, it appears, to show how defenceless our coasts are! Meanwhile, a campaign has already been begun to bring about an increase of the infantry from thirty to at least seventy regiments. Five were added by the reorganization of 1901, although each regiment was given two extra companies in 1898. Now the plea is that we must have younger officers in the responsible positions, just as the navy boomers are insisting that our naval captains should never be over forty-eight years of age. If one argument does not serve, another will. The Japanese trouble plays its purpose here as well as with the navy. Then there is the cavalry; there is a block in promotions in this branch which is putting it at a disadvantage as compared with the others. Naturally, the cavalry now sees grave reasons of state why at least

five regiments should be forthcoming next winter. This game can be played just as long as people are gullible.

The British Admiralty is not satisfied with its recent extraordinary development of the torpedo-boat destroyer. In 1893 its largest boat of this type was the Havoc, of 240 tons, 3,500 horsepower, and 26½ knots. Five of the boats authorized in 1905-06 are now taking the water, the Ghurka and Afridi having recently been launched. These boats are of 790 tons, 14,500 horsepower, and have a speed of 33 knots, three more than any of the destroyers owned by Germany, France, or the United States, and are 200 tons larger than the largest foreign boat. Not content with this leadership, the Admiralty has laid down at Birkenhead the Swift, a destroyer of 1,830 tons, 30,000 horsepower, with the phenomenal speed of no less than 36 knots an hour. The Swift is to be an ocean-cruising boat with a great radius of action; and, having the pace to overhaul any torpedo-boat or destroyer, cruiser or battleship, will truly become "the eyes and ears of the fleet." Both the Ghurka and the Swift have high freeboards, and are comfortable and livable vessels, instead of racing machines which utterly exhaust their crews in a few days. It is now apparent that in the eyes of the Admiralty the torpedo-cruiser and torpedo-gunboat are failures, the former because its scouting powers were sacrificed to its armament, and the latter because it was neither a scout nor a destroyer. Only three 12-pounders will be carried by the Ghurka and four 25-pounders by the Swift. A clearer example of the way the British Admiralty leads the whole world in naval construction and development it would be hard to find. Every other country is an imitator, and at that from three to five years behind.

Among the steps taken by the British authorities to suppress the revolutionary disorders in northwestern India is the arrest of an influential native barrister who has been the most conspicuous leader in the anti-British agitation. The advocates of a strong policy in India are never tired of reiterating that the present unrest proceeds not from any feeling of discontent among the "great silent mass of the population," but from the selfish ambition of "the briefless native lawyer, the needy schoolmaster," and others whom the Government has educated. Yet it is hard to say where opposition is to come from if not from the classes that have been educated, though educated to discontent. Of India's more than 290 million inhabitants, a little over 14 millions, or less than 5 per cent., are able to read and write. On the other hand, the annual enrolment at the five universities (Calcutta, Madras, Bombay, Punjab, and Allahabad) shows an average of nearly 8,000 for the last five years. The University of Madras, for instance, at its last convocation in March, conferred degrees on 760 students, among them eight women. With a vast, ignorant population as raw material for sedition to work on, and with large annual reinforcements poured into the ranks of the learned and agitating class, the situation certainly presents a formidable parallel to that in Russia. When popular discontent is intensified by religious fanaticism, conditions become still more serious. The curious mixture of motives to which the Indian agitator can appeal is illustrated by a statement from a Calcutta newspaper that "one of the stock arguments brought forward by the Swadeshi people [Bengal boycotters] against the use of sugar manufactured under European methods was that it was defiled by the use of blood and bones of kine, and was therefore unfit for the use of Hindus."

In expectation of a ministerial crisis as a result of growing discontent with the general labor situation, French politicians have been making a bid for office by calling for a return to moderate principles in economic and social legislation. M. Poincaré, a former Minister of Finance, came out boldly against the Ministerial policy a few days ago; and it may have been the recognition of the strong sentiment behind him that actuated the Government's recent sharp declaration, through the mouth of M. Briand, against "the violence and tyranny of the revolutionary General Confederation of Labor." On the allied burning question of the hour, the organization of the school teachers and other employees of the state into unions with the right to strike, the Minister of Education pronounced an equally emphatic negative. In the personal evolution of M. Briand, the declaration should mark a more decisive break than ever with his original Socialist principles and associates, "independent" though he has been for many a day. But M. Briand's course is in turn symptomatic of the times. Undoubtedly, a good part of the country is afraid of the present Government's economic theories. In addition, there is the prevailing unrest among the workingmen, which has been described by the French Ambassador at London as responsible for the lack of enterprise, verging on timidity, that characterizes the industrial and commercial life of the country. "We often hear of this or that industrial establishment which, in spite of prosperous conditions, is compelled to abstrain from increasing its plants and agencies because increasing the number of workmen means increasing the chances of strikes."

The opinion that the approaching Franco-Japanese agreement will be favorable to the general situation in China is borne out by a statement of the Japanese Ambassador at Paris. M. Kurino says that the proposed understanding would include a clause guaranteeing the independence and integrity of the Chinese Empire. Readers of Mr. Putnam Weale's "Reshaping of the Far East" will recollect the importance which the author of that well-informed book attached to Franco-Belgian influence in China before the war. French and Belgian capital, in fact, was one of the two levers with which the Continental Powers were working to heave over the vast structure of the Celestial Empire, the other being Russia's direct assault on the territory of the Empire. The author may have been over-emphatic in his conception of a conspiracy of the Continental European Powers engaged in the undermining of Chinese independence, and held in check only by Great Britain and Japan, but it would seem plain that the best interests of the Empire for the present are subserved by an understanding among all the Western Powers and Japan. Germany, there is little reason to doubt, will sooner or later subscribe to some such agreement as that formed by the other governments. We may look forward, therefore, to a situation in the Far East analogous to that in the nearer Orient. The example of Turkey is, on the face of things, not a happy one to quote; alliances do not preclude international bickerings and intrigue; but, on the whole, the Chinese Government, deprived of its old method of playing off nation against nation, and secure at the same time in its authority, cannot but be moved along the way of real progress.

Recently the old dispatch from Constantinople came again. Our determined Ambassador had got audience of the Sultan, and the long-standing American claims against Turkey were on the point of being settled at last. We have had this news, at regular intervals, for some years, so that skepticism is now as recurrent as the dispatch. Missionaries in the Turkish Empire, and missionary boards at home, have about given up hope that Ambassador Leishman will accomplish anything for them. Americans in Constantinople tell, with a mixture of amusement and disgust, what they assert to be the true story of our Ambassador's long-awaited interview with the Sultan. He produced, it is said, a list of demands, at the head of which stood one for the admission of American pork products! Considering what Mohammedans think of swine's flesh, this was about as tactful as would be a demand by the Turkish Ambassador at Washington that the Grand Vizier be allowed to marry twenty American girls at once on the steps of the Capitol.

POLITICAL EDUCATION BY BOODLE.

Secretary Root's lecture at Yale Monday, in the annual Dodge course on "The Responsibilities of Citizenship," contained many forcible observations. In particular, he was pungent on the false conception of government as a thing apart from ordinary life. He showed, on the contrary, how in self-governing countries the choice of representatives and the making of needful laws become, of necessity, the business of all good citizens. For that fastidiousness of class which would neglect political duties, or delegate them to a professional clique, Mr. Root had nothing but scorn; while he had some vigorous words on the folly of deploring frequent elections and regarding them as a great bore. A contested election, he maintained, is one of the greatest factors in the political education of a democracy. Nothing, he argued, is so important even to business, "because it is this educational process that is laying the solid foundation of sound judgment, sober self-restraint, and familiarity with political questions among the governing mass, upon which the security of all business depends."

From these impregnable positions, however, it was a perilous sally to an exposed point when he ventured upon a quasi-defence of the lavish use of money in politics. Admitting that there have been some "abuses" in the raising of campaign funds, he contended that, after all, "there is no more useful expenditure of money from the public point of view"; for it is money "applied to the political education of the voters." But in this he showed, we think, less than his usual careful discrimination, and did not keep his eye as closely upon the facts as might be expected of him. And if the newspaper reports of his lecture do not do him injustice, he failed entirely to press the argument for a reform of those abuses which he conceded to exist.

We freely grant that Presidential elections are thoroughly educational, and also that their legitimate expenses have increased with the growth and heightened complexity of our citizenship. This is allowed for in the plans of all reform legislation. Nobody wishes to cut off a party from the means of circulating appeals, stating its principles, holding mass-meetings—in a word, getting the issues as fully before the voters as possible. It would probably be out of the question to conduct a campaign in Pennsylvania to-day, as Col. McClure said the first Lincoln campaign was conducted, at a total cost of $12,000. But it is a long leap from that to a justification of Quay bleeding office-holders and blackmailing protected interests so as to get a fund of $200,000 merely to keep himself State Chairman. In such a wild excess of corruption there is undoubtedly a certain sort of political education, but scarcely the kind that Secretary Root had in mind.

What he wholly omitted to state is the fact that most of the large contributors to campaign funds have not the least desire to "educate" the voters. Their aim is much more simple and direct. They want to buy votes. And their motives are purely selfish. It is not the triumph of a political principle, or even of a party as such, that they pay out their thousands to compass, but the purchase of privilege or the guarantee of immunity. Mr. Root could not with a straight face stand up and contend that the protected manufacturers who all these years have yielded their "fat" to the Republican managers, or the insurance and other corporations which have drawn their checks to the order of the same party, had the faintest notion of "educating" anybody. It was a strictly business operation. They paid out their good money expecting full consideration for value received. And they asked no questions how their cash was to be expended. Most of them, however, must have been morally certain that it was to be laid out in bribery. That, in fact, is the species of education to which a large part of the money so copiously poured into Republican coffers during the past twenty years has been notoriously devoted.

We are not left to guesswork in this matter. Precise details have been put before us. Take the letter in which Mr. Root's former client, Mr. Harriman, explained his financial activities in aid of Roosevelt's election in 1904. After recounting how he had himself given $50,000 to that end, and raised $250,000 more among his friends, he averred that this sum of $300,000 must have "turned" in the city of New York alone "at least 50,000 votes." Now, does any sane man suppose that Mr. Harriman imagined for an instant that these votes were turned by argument or "literature"? The thing was a simple problem in arithmetic—50,000 votes, at $6 each, foot up $300,000. A large body of venal voters made necessary a large bribery fund. That was the whole of it. And the evidence which the Corrupt Practices Association collected in Clinton County and other parts of the State, and put into legal form for presentation in court, left beyond all doubt what is done with the election money in the rural districts. It goes into the hands of the honest yeomen, in sums of from $2 to $10, to pay them for their votes.

We could wish that Secretary Root had fixed his acute gaze upon these evils, and lent his influence to the cause of purer elections. The movement is strongly under way. Progressive men like Gov. Hughes have given it their aid. Bills are pending in State after State, and laws are passed, to prevent that debauchery of the electorate upon which Mr. Root touched all too lightly. No doubt, there is political education to be gained through bribery; but it consists in opening the eyes and rousing the consciences of honest men, as in England, so that they see the imminent peril to the very bases of government. In one word, the true educating power of the huge campaign funds of the Republican party lies in its teaching citizens the need of taking effective measures to prevent the collecting of such sums of money at all. If there is any instruction in boodle, it is to beware of it and abolish it altogether.

UNION PACIFIC'S BORROWINGS.

The announcement last week of the new capital which the Union and Southern Pacific railways propose to raise, would probably have attracted less attention, but for what is now generally known as the "Union Pacific episode" of the past nine months. The salient facts brought to public attention in that interval have a bearing on the present move. On August 17, 1906, Union Pacific's annual dividend rate was suddenly and unexpectedly raised from 6 to 10 per cent.; simultaneously, a very wild speculation for the rise broke out in all active shares on the Stock Exchange. The outcome of the ill-fated "autumn boom in stocks" is too fresh in mind to need to be recalled; the point of interest lies in the circumstances under which it was conducted.

A natural presumption was, that the rash speculation merely resulted from the unexpected "Harriman dividends," and from perverse misjudgment of the real situation by the very rich capitalists in the Union Pacific coterie. In November, however, something happened which made the financial community prick up its ears. Union Pacific published its annual report; the balance-sheets of June 30, 1906, the end of the fiscal year, made the extraordinary showing of $21,258,883 cash on hand, or in bank, and $34,710,000 outstanding in demand loans—a total of instantly available cash amounting in all to nearly $55,000,000. Wall Street at once asked what had been done with this great sum, in the five months which had elapsed since the thirtieth of June, and which had been marked by so extravagant a Stock Exchange speculation. Answers to this interesting query were mere conjectures until, in January, the Interstate Commerce Commission publicly produced, from the books of the Union Pacific, evidence that the company, in this second half of 1906, had actually expended $131,000,000 in purchase of stocks of other railways, mostly bought in the open market.

We do not recall these well-known incidents to repeat the severe criticisms made at the time by competent and unbiassed judges, but to show wherein the present announcements are connected

with these events of 1906. It had been for some weeks reported that the Union Pacific was about to appear in the money market as a borrower; its share of the thousand-million-a-year expenditure, lately declared by Mr. Hill to be necessary for proper improvements on the country's railways, would presumably be considerable. But the money and investmeut markets were extremely unfavorable; hence it was rather generally inferred that the company would endeavor to raise only such sums as were imperatively required for its physical improvements. This will explaiu why the news of an immediate issue of $36,000,000 Southern Pacific stock and of $75,000,000 Union Pacific bonds took Wall Street by surprise.

Surprise was changed to a stronger feeling when it was learned that, of the money to be thus borrowed on bond and mortgage by the Union Pacific, no less than $60,000,000 is to be used, not for improvement and betterment on the lines of the company, but for paying off floating debt, contracted last autumn in buying stocks of other railways, or for purchase of more of such stocks. That is to say, notwithstanding the Union Pacific's quite unparalleled showing of ready cash on hand last June, it has thrown the whole of it into stock purchases—often of roads, like the New York Central, not even connecting with Union Pacific—has placed in similar investments everything else available in ready money, has privately put out its notes, to the tens of millions, in order to buy more, and is now coming into a confessedly doubtful money market to raise the capital to pay off floating debt and equip the company, if it so desire, for more operations of the sort.

It is not our purpose to insinuate that the Union Pacific is unable to endure the strain of prolonged fiuancieriug of this nature. Partly by peculiar good fortune in the direction taken by the "American boom," and partly by Mr. Harriman's undoubtedly skilful operating management, the company is extremely strong, and better able than many similar corporations to take risks in such directions. Nevertheless, we trust that no friend of sound financial methods will neglect to point out, as the *Nation* has done and will continue to do, that this is dangerous railway finance, and utterly demoralizing in its influence on the community at large. It is our sober judgment that, had the railroads indulging in this kind of stock operation been confronted, since 1901, with such situations as faced the Reading in 1892, and the Atchison in 1893, after similar experiments on their part, the reckoning would have been very serious. We shall, no doubt, be told that such a comparison fails, for the simple reason that this is not 1892 or 1893, and that the railway managers now conducting the stock operations are men who make no such mistakes as were made by McLeod and Reinhart. Prudeut and experienced people are aware just how much weight this argumeut deserves. It is a line of reasouing, moreover, to which Mr. Harriman himself gives a sufficient answer. In a statemeut prepared to show that the Union Pacific has made a good thiug, in a speculative way, because of the rise in price of stocks, such as Northern Pacific and Southern Pacific, bought by the company in 1901, he also admits that, on the stocks bought during the last half of 1906, Union Pacific's loss in market values somewhat exceeds $18,000,000. The inference, as applied to a more or less uncertain financial future. is sufficiently obvious; not less so wheu these ventures in stocks are conducted with money raised through mortgaging the property of the company which buys them.

THE TRUSTS AND INDUSTRIAL CONCENTRATION.

One of the most striking facts iu the Federal Ceusus of Manufactures of 1905 is the tendency shown toward concentration into relatively few large establishments. Although the five years since 1900 yielded a remarkable development in output—no less than 30 per cent.—the number of establishments remained almost constant, with au increase of only 4.2 per cent. In almost one-half of the industries separately enumerated, there was either no increase at all in the number of plants, or a positive decline. Over 300 sugar refineries, almost 300 tanneries, over 200 woollen mills, and nearly 300 shoe factories disappeared from the records altogether; while the number of slaughtering plants, tobacco factories, paper and carpet mills, and the like, remained practically unchanged. And yet the annual product in 1905 exceeded that of 1900 by $3,391,600,000. What does this mean? Is the small manufacturer doomed to follow the ichthyosaurus and pterodactyl? May he, at best, hope to hang on to the friuge of things, like the duck-billed platypus in Australasia?

For purposes of closer analysis, comparisons may be instituted between manufactures, grouped in three classes. The first comprises those industries dominated either by the old-timers among the Trusts, such as petroleum aud sugar refiniug, liquor distilling, and tobacco; or those dealing in great staple products, like beef, salt, with iron and steel. One need not name the Trusts; in at least seven industries distinguishable in the Census returns they monopolize from 75 to 90 per cent. of the business. The second group includes those industries controlled by a monopoly of from 40 to 75 per cent. These secondary, or imperfect, monopolies include such industries as the manufacture of woollen and worsted goods, leather, wood-pulp, paper, fertilizers, silverware, and rubber goods. Ten fairly distinguishable ones may be taken as typical. A third group comprises the lines of manufacture still conducted under old-fashioned conditions of free competition. Five such may be selected from the Census returns; cotton goods, boots and shoes, silks, knit goods, and carpets. If the Trusts, as monopolies, are indeed responsible for the industrial concentration, so notable since 1900, differences of degree ought to appear on comparison of the returns from these three distinct groups. If, on the other hand, we are confronted by a well-nigh universal tendency toward large-scale production, these groups should manifest the drift to concentration in about relatively equal proportions.

The facts are contained in the following table:

NUMBER OF ESTABLISHMENTS.

	1900.	1905.	Change Per ct.
Practical monopoly (7)...	3,450	2,990	−13
Imperfect monopoly (10).	5,299	4,754	−10
Independent (5)	4,242	4,356	+ 3

VALUE OF PRODUCT.

(Million dollars.)

	1900.	1905.	Change Per ct.
Practical monopoly (7)...	2,072.9	2,416.9	+16
Imperfect monopoly (10)..	616.7	822.6	+33
Independent (5)	859.4	1,114.3	+30

All due allowance being made for the imperfect character of the data, these statistics are in line with probability, so far as the influence of monopoly is concerned. Concentration varies more or less directly with the degree of monopolization. Even after long antecedent experience, the great staple combinations during these five years have either retarded the growth of independent plants, as in the slaughtering, iron and steel, and petroleum industries; or, as in liquor distilling and sugar and salt refining, have consolidated separate establishments; so that the decline in the number is very striking. Among the imperfect monopolies, the decline in establishments is appreciably less. No striking reductions appear, except, perhaps, in the case of tanneries, woollen mills, and rubber plants. There were about 20 per cent. fewer leather establishments, and about oue-sixth fewer woollen and worsted uills. The number of rubber and rubber goods factories was smaller by 23 in 1905, although the product increased over 40 per cent. The number of wood-pulp paper mills remains practically unchanged, despite an output 50 per cent. greater at the end of the five years. And this is roughly typical of the remaining imperfect monopolies in this class.

As for the independent, still unmonopolized industries, they alone as a whole bear witness to a growth in the number of establishments, commensurate with the substantial increase in output. The development of the South has led to the

construction of about 10 per cent. more new cotton mills; and there are nearly 30 per cent. more silk mills. But, on the other hand, concentration in boot and shoe manufacture reduced the number of establishments 18 per cent., despite an increased output of about one-fourth.

The tendency toward industrial concentration is thus pronounced all along the line. The five years under consideration bear witness to it in the most positive manner. But, in addition, the influences making for monopoly have since 1900 greatly increased in intensity. The outburst of Trust promotion in 1899-1901 was one of the most notable events in our entire economic history. In a night, as it were, industrial combinations sprang up on every side. Exactly half of the "Trusts" enumerated by the Census were floated within the eighteen months prior to June 30, 1900. No less than $6,000,000,000, par value, of new securities—equal to seven times the national debt, and three-fourths of the market value of all railroad stocks and bonds—were offered to the public. Unless either the current be changed, or the tariff speedily revised, we may confidently expect to see monopoly working out its destiny even more overwhelmingly in the future. If tariff revision will stem the tide, it cannot be too soon attempted.

MODERN STRIKE TACTICS.

There are certain features about the present dock-workers' strike in New York which, in common with what we learn of the methods of conducting labor wars in other countries, indicate a marked progress in what almost deserves to be called a science of strike tactics and strategy. Differences of opinion exist as to whether the 'longshoremen, who have succeeded in fairly tying up export traffic in the harbor, are "organized" or not; but it seems hard to imagine that some 20,000 men could have been brought to abandon work with such unanimity, and to abstain from work with such resolution, otherwise than by skilful preliminary agitation and subsequent firm leadership. How far the leaders of this strike or any other American strike have profited by classic European models is difficult to tell; but it is suggestive to find an incident like that of the solitary New York stevedore who was permitted to resume work, in order not to forfeit his service pension, absolutely paralleled among the striking steel-workers in the town of Terni, Italy.

The strike at Terni illustrates admirably the systematization of labor war methods. From the *Giornale d'Italia* of last month we learn that the 3,500 strikers were divided into "battalions" according to the special branch of the work in which they were engaged. Each battalion was subdivided into companies under captains whose duty it was to present at the bureau of labor a detailed daily report of events in their respective commands, of which there were some fifty. In this manner the leaders were constantly in touch with the sentiments of their followers, and "perfect accord" was easily maintained without recourse to the cumbrous method of a referendum. To feed their army and maintain its discipline the leaders adopted various means. Outside aid was obtained through the efforts of a committee "with correspondents in all other Umbrian cities." Work was found in other towns for the skilled laborers whose earnings went to support their idle companions. The aged were permitted to resume work in order to secure their long service stipends. There was no false sense of pride among the organizers of the strike. Ultimate victory was what they aimed at, and if it was necessary to beat a temporary retreat, why, that was a part of war. "It is not impossible," said one of the leaders, "that a partial resumption of work may be decided upon." If the enemy could not be overthrown, he might at least be lamed.

A novel feature of labor warfare which has made its appearance in France and Italy during the last few months can be best described as one that applies to social conflict the rules of the Red Cross with regard to non-combatants. It consists in sending away the children of destitute strikers to be cared for by "proletarian" families in other towns. In the *Giornale d'Italia* we read that in a prolonged strike at Argentano in northern Italy, "fifteen children have passed through Ravenna this morning on their way from Argentano to Civitella. To-morrow fifty others will arrive and will be received by the socialist families of Ravenna. Three hundred had been asked for." At Fougères in northwestern France a bitterly fought contest led to a similar exodus of children towards one of the northern towns. Paris, eager for sensation, made a holiday of it when *les petits Fougérois* passed through the capital; the children were received by labor-union representatives and driven from railway station to railway escorted by a crowd chanting the "Internationale," the new song of proletarian revolution. This is evidence undoubtedly both of a sense of solidarity among the workers and of the shrewdness of their leaders in making use of a device which both relieves their fighting forces of heavy impedimenta and brings them a certain amount of sympathy.

But the strategy of the modern strike is not wanting in certain vicious theories, which, it is just fair to say, have so far been advanced only by extremists of the revolutionary type, such as have played a prominent rôle recently in the continuous strike agitation at Paris. Thus, there is the system of reprisals which has received the name of *sabotage*, and which consists in destroying the usefulness of a machine by the removal of an essential part, or in the adulteration, "scamping," or actual vitiation of a particular product. Bread was to be turned out underbaked or overdone, grocers' assistants were to give either short weight or excessive weight, and there were not wanting hotheads to hint at the resources which druggists' assistants had at their command for enforcing their views upon "society." The Paris *Figaro* lightheartedly quotes a number of imaginary items from the daily papers of an age when *sabotage* shall be triumphant:

Sudden death. A few days ago the chief engineer of the *Santos Dumont, No. 13741*, purchased a box of lozenges, of which he gallantly offered some to a young lady of his acquaintance and to her excellent mother. All the symptoms of strychnine poisoning immediately manifested themselves, and the physicians have abandoned hope.

A curious contrast. One of our subscribers, whose doctor's prescription called for arsenic and nux vomica, has discovered that the arsenic furnished him was only powdered sugar and the nux vomica was Malaga. It would appear that our pharmacist's clerks, in substituting poisonous ingredients for inoffensive substances, have also reversed the process and given us the most agreeable of harmless stimulants for poisons.

We have spoken before this of the new labor policy of conquering the power of State by means of organizing for combat all classes of public servants, culminating in a great strike of the army itself. School-teachers, jailers, postal-servants, Government clerks, all are to strike in their turn, or together. Concerning this danger of the universal strike, *Figaro* has the following report from the future:

At the Hospital Louis (formerly Saint-Louis). A strike of the hospital attendants, which was declared a few days ago, has led to a counter-strike on the part of the patients. All the inmates of the Hospital Louis have suddenly left their beds and resumed their ordinary occupations.

THE DEARTH OF PLAYWRIGHTS.

Talking in Washington the other day, Mr. Bryce remarked that the present condition of the drama affords one of the most puzzling phenomena of the age. How is it, he asked, that, whereas two continents are mad over the theatre, and in all large cities some of the finest sites are occupied by splendid playhouses—how is it that, in spite of every conceivable incentive to the making of good plays, there are no really capable dramatists? The British Ambassador might have found the answer suggested by his very question. The palatial temples of amusement which arise

on every side are, in most cases, signs, not of the prosperity, but of the degradation, of the drama. They are monuments, not to the triumphs of literary or histrionic art, but of a system which has prospered temporarily by putting an end to competition, adopting an exclusively commercial policy, catering to the grosser tastes of the multitude, and, by denying opportunity, crushing the development of budding genius.

Various replies have been offered to Mr. Bryce's inquiry, but none that we have seen has dealt with the plain facts, or been either explanatory or sufficient. In one instance an effort was made to prove that the English and American stage is not so utterly destitute of dramatists as might appear at first sight; that setting the great Elizabethans aside, our best modern playwrights do not suffer so very much in comparison with the old; that the Restoration comedy is not to be desired, regretted, or imitated; that the Georgian drama was either too heavy or too artificial to be tolerated now, and, moreover, that signs of a coming higher and worthier drama, if rare, are already perceptible. Mr. Bryce is not likely to regard this plea as very successful. He is under no illusion concerning the literary quality of the contemporaneous theatre, and knows that an occasional good play, conspicuous by its loneliness, does not necessarily portend a dramatic revolution.

The actual state of affairs is again and strikingly illustrated by the latest theatrical combination. One of the principals to that bargain asserts that there is no alliance, but simply an agreement for mutual advantage and a burying of the hatchet. The meaning of this is that a considerable part of the not too formidable competition with the Theatrical Trust has been extinguished. The motive of the amalgamation was expressed very bluntly by one of the contracting parties. There were too many first-class theatres, he said, in this city, and the plan was to turn several of them into music halls. "Too many first-class theatres in New York!" Few persons ever suspected the fact. The phrase, of course, refers solely to the houses where the expenses behind the curtain are held to justify the highest scale of prices for the seats in front of it. Money is to be made more easily out of the cheap vaudeville entertainments, which appeal to the coarser humors of the crowd, than in the regular theatres, except during the run of an extraordinarily popular play. This fact accounts in large measure for the managerial demand for such plays—rural and musical comedies, with their inserted "specialties," for instance—as most nearly resemble a music hall entertainment.

Thus the old, broad distinction between the theatre and the music hall is growing narrower year by year. This fact, now that both forms of entertainment are coming gradually under the same management, may assume a new significance in the near future. It seems safe to predict that hereafter any theatre which fails to be remunerative at high prices will be added to the music hall circuits. In other words, a poor show that fails to draw will be replaced, not by something better, but by a show that, in an artistic sense, is poorer still. It is these circuits that are the curse of the whole theatrical situation. They are most cunningly adapted to their commercial purpose, but absolutely fatal to artistic progress. By their agency, worthless plays are kept alive year after year, all competition is blocked, actors are deprived of essential training, and new authors of all opportunity. Their baleful influence extends also to the so-called independent managers, who, although they rebel against the terms and conditions of the Trust, and to that extent are entitled to the sympathy of intelligent theatre-lovers, are nevertheless following the same pernicious system, seeking to establish a chain of theatres in which their plays may be performed in almost endless rotation, with very little reference to their merit.

There are exceptions to every rule, but, speaking generally, the managers of the Trust theatres take no risks that can be avoided. They shun experiments. Their chief care is to secure plays that have succeeded elsewhere. If they must use untried pieces, they take them from authors who have already won popular favor. This is why so few fresh names are seen upon the playbills, unless they be those of adapters of some well-advertised novel. Since the theatre has become a mere money-making machine, its capacity for artistic development has been paralyzed. Its condition is not quite so hopeless as it seemed to be a year or two ago, because the independent managers, more or less shut out from the available European and American play-market by the Trust, have been compelled to look about for new material. Thus, for the first time in a good many years, there is an opening for a fresh generation of American playwrights. Already, Mr. Moody has given us "The Great Divide," a notable, if somewhat crude, work, and Mr. Percy Mackaye, his "Joan of Arc," than which there has been nothing better, from an American source, since Boker's "Francesca da Rimini," Young's "Ganelon," and Aldrich's "Judith of Bethulia." May they prove the first-fruits of an abundant harvest! So far as America is concerned, the dearth of playwrights must be ascribed to a vicious managerial system, rather than to the poverty of native talent.

AUSTRALIAN FICTION.

SYDNEY, April 18.

The literature of England, like its science, has been continued at the Antipodes by a kind of apostolical succession. All the early poetry, fiction, biography, and history produced in these colonies was the work of men who had received their training and their inspiration in the motherland. The succession has been but slightly physiological. Though sons of Dickens and Anthony Trollope reside in Australia, they have not followed in the paternal footsteps; but Henry Kingsley is the father of Australian fiction. Fired by the same spirit of adventure as animated Charles, Henry came out to Australia when the gold-fever was at its height, and he was a chief figure in the constellation that made Melbourne for two or three decades the intellectual capital of the country. Other members of it were Richard Hengist Horne, author of the farthing epic, "Orion," the two Howitts, Adam Lindsey Gordon and Henry Kendall, the two chief Australian poets, and Marcus Clarke, the chief Australian novelist. Horne was the centre of a group of clever writers who met in Dwight's bookshop in Melbourne. These created literary life in Melbourne and long kept it vigorous. Out of it came Kingsley's "The Hillyars and the Burtons" and Marcus Clarke's "For the Term of his Natural Life." The former is perhaps the first novel where Australian life was found to be susceptible of æsthetic presentment.

The earliest notable Australian novel was thus an English book. So, in a manner, was the second. B. L. Fargeon was both an Australian and a New Zealander when he felt the stirrings of ambition to achieve a career in a wider field. He cannot have been the earliest Australian writer to adventure on literature in England, but he was the earliest to earn fame and a competence there. His first book, "Grif," was published so long ago as 1869. All of it that remains in memory is a description of the night-side of then mighty, but now fallen, Melbourne vivid enough to be worthy of Dickens at his second-best. The book was probably written here, but was published in London. Henceforth, Australian fiction was to be, in good part, issued as well as produced in the scenes it described.

In the following year Marcus Clarke's powerful story, "For the Term of his Natural Life," was published in the *Australian Journal;* four years later, rewritten, it had to seek an English publisher. It was long —perhaps is still—held to be the Australian classic in the department of fiction. It is the solitary survivor of a host of convict-novels, describing the system in its worst days, and is painted in lamp-black, with never a bright tint, but only flames as of Hell to light up its dark expanse. "No man ought to write so," as Emerson said of Hawthorne's sombre tales. Other writers of less note have perceived even in convict Australia redeeming features. "Assigned to his Wife," narrates the fortunes of a convict whose wife devotedly followed him to New South Wales, where the severity of the system had been mitigated by the assignment of convicts to settlers as mechanics and laborers. "The Golden Secret" is likewise brightened by glints of hope, and lightened by touches

of pathos. Yet the greater work was needed to brand into the consciousness of Australians the remembrance of their origin and the large part that convictism has played in their history. It is also the permanent deposit of the system in literature. Resembling ancient slavery and the old Roman *ergastulum*, it was none the less unique—the most finished example of a convict social state and the convict initiation of free communities.

Bushranging was the daughter of convictism. Most of the older bushrangers were or had been convicts, and they often trained their sons to lead the same life. Like convictism, bushranging was destined to find its "sacred bard." Thomas Alexander Browne, who assumed the name of "Rolf Boldrewood," was successively squatter or grazier, police magistrate, and gold-fields commissioner. In these capacities he amassed a wealth of colonial experience. Beginning to write only in the evening of his days, he first recalled the many vicissitudes of the sheep-breeder's life in a series of papers entitled, "Ups and Downs," afterwards republished in London, as "The Squatter's Dream." It had no success. Then he struck a rich lode of virgin ore in "Robbery Under Arms." At first issued in a Sydney weekly, it attracted little attention. Rewritten, it was published in London, and it immediately established the author's position. The book was recognized as at once a genuine work of art and a true picture of Australian life in the wild early days. It is obviously no fiction, but reality, truly seen, powerfully felt, and vividly delineated. The characters are lifelike, their language sincere, their acts natural. The corruption of well-principled youths by their father, their gradual descent, and their futile efforts to resist the declension, are drawn with the poignant intensity of a master of human nature. The work will rank with another, kindred masterpiece, Karl Emil Franzos's "For the Right."

Having found his vocation, Boldrewood proceeded to coin the stored experience of forty years. He has produced almost a score of full-sized novels, faithfully representing life at the diggings and in the bush, in rural and urban surroundings, among bushrangers, and among politicians, and the wonderful octogenarian's fertility is still unexhausted. Doubtless, they are the strongest and most mature of Australian novels. But they have a further attraction. They are a mine of wealth for the recovery of old colonial life, and from them a whole gallery of almost extinct sociological species could be reconstructed.

More modern Australian fiction has deserted the bushrangers, while still clinging to the bush. Life there is distinctive, and (if the main features are those of all pastoral countries) it is unlike in its coloring and detail to any other. Some of its tragedy and a good deal of its farce, its prosaic routine, its rivalries and intrigues, its fashionable "society," with its inclusions and exclusions, its haphazard marriages, illicit relations, and the consequences of these, are well depicted in "An Outback Marriage," by A. B. Paterson. A true story—a *cause célèbre* of some few years ago—furnishes the backbone of the tale. But the story is secondary, and the title a lure. Continually, the thread is dropped for the sake of describing scenes and incidents. Leading characters are left long in abeyance. The development of a complicated plot, subtle character-drawing, psychological situations, exhibition of the internal machinery of the whole, and depth of reflection—all that constitutes the glory of the "new novel"—are conspicuous by their absence. And yet the book possesses what many "new" novels lack—an attaching interest that carries the reader on from chapter to chapter, and leaves him satisfied at the end.

At bottom, it is an essay of descriptive sociology. The object of it is to exhibit station life, and to that end characters, situations, and events are made subservient. A rare faculty of delineation rewards the reader with the vision of scenes that have never before been painted, or never so well. Poet Gordon's "running fire of stockwhips and fiery run of hooves" is expanded into a vivid sketch of the mustering of wild cattle. The methods of the dissemination of news are dramatically shown, and they explain the rapid diffusion of inteligence in primitive countries. The incidents of coaching, buck-jumping, and horse-breaking, opossum-hunting in the interior, and buffalo-hunting in the far north, sheep and cattle "lifting" on a large scale, "bush larrikinism" at balls in Sydney, no less than the beneficent part of women in bush life, are all touched on with a skilled hand. The personalities of the bush—the station-owner, with his "gins," and the station-manager, with his ladies, the bush lawyer (suggestively called "liar") though not the bush parson—are outlined. All this and much else. The American reader desirous of learning something about station life in the heart of Australia could nowhere find a better or brighter account of it.

Not only life on a great station, but also life on a small "selection," as a farm on selected government land is called, has (last in the order of time) formed the theme of much recent literature. Only the other day the Rev. James Green, who was chaplain to the Bushmen's Contingent in the South African war, produced "The Selector" (published in Sydney). Mr. Green knows his bushman well, and his pictures of the very urban yeomen who form the substance of bush life, as of the "sundowners," "jackeroos," and the others, who hang on to its fringe, are recognized as verisimilar. In "Aventures et mœurs australiennes," lately published in Paris, Paul Warrego (who can be no other than Mr. Denis O'Donovan, formerly Parliamentary Librarian in Queensland) gives of the same types a lifelike description that has received the imprimatur of the Australian press. Both the ex-chaplain and the ex-librarian treat the subject seriously, but it has other aspects.

The Moderator of a Presbyterian General Assembly warned a newly ordained minister, who was about to be sent to the back blocks, that he would find there a spiritual torpor such as would fill him with horror and dread. From the religious point of view a state of spiritual death is doubtless the lowest deep, but the reader of such books as "On Our Selection" (published in Sydney, with a brighter continuation, "Black on our Selection," published in Brisbane) is still more repelled by the squalor, the meanness, the misery, and almost the savagery of farm life in the interior of Australia. "Steele Rudd," or Arthur Hoey Davis, draws a picture of the pioneer small farmer in Queensland that is probably true of Australia in general. It is said to be drawn from life, and it is certainly unflattering—Australian "interiors" indeed, such as hopelessly distance the homeliest "Dutch interiors" ever painted! Profound sadness is the emotion it excites in the graver minds, but most of its many readers have found it a screaming farce. At all events, it reveals the emergence of Australian humor, which is evidently going to be of the broadest type. Steele Rudd is chronologically the first of Australian humorists.

Our survey of Australian fiction is obviously incomplete. The charming stories of Australian child-life by Ethel Turner, and Mr. Louis Becke's lurid pictures of the relations between whites and blacks in the Melanesian Islands of the Western Pacific, merit a critical appraisement. Mrs. Campbell Praed's novels, though produced in England, really belong to Australian literature, while Ada Cambridge's many works, though produced in Australia, really belong to English literature. Taken along with those already described, they would seem to show that, if Australian fiction is still in its infancy, it is a vigorous, if not quite a Herculean, infancy. J. C.

NEWS FOR THE BIBLIOPHILE.

The copy of the 1894 large-paper edition of Holmes's "Autocrat of the Breakfast Table," with illustrations by Howard Pyle, which had been presented by the author to Charles Marseilles of Exeter, New Hampshire, was sold in Philadelphia last week for $180. The catalogue contained this note:

This is one of three copies of an intended edition of 250, on large paper, gotten up especially for Christmas, and all of which were destroyed by fire excepting three copies.

We have before us a letter of the late Mr. Marseilles, dated March 21, 1904, in which he says, referring to this copy of the "Autocrat":

A Boston bookdealer offered me $750 spot cash for said two volumes, which I declined. A representative of D. Appleton & Co., of New York, a week later called on me. I showed him said two volumes of Holmes's "Autocrat," and said a Boston bookdealer last week offered me $750 spot cash for them. He said: "Well he might, Mr. Marseilles! There are but three sets in existence of that edition of Dr. Oliver Wendell Holmes's 'The Autocrat of the Breakfast Table.' It seems Dr. Holmes presented you with one set. The three sets are to-day $1,000 each on the market."

How this statement of the three copies could have originated it is difficult to understand. The edition was never destroyed, and Houghton, Mifflin & Co., the publishers, state, under date of May 3, that they have some copies of the edition of 250 still unsold, which are offered at the original price of $12. The $180 paid for the presentation set is not an unfair price, but the subscription agents who led Mr. Marseilles to believe the set was worth $750 or $1,000 probably had some ulterior purpose in thus deceiving him.

On May 31 and June 1, Sotheby holds an-

other important sale, including the four folios of Shakespeare, and many of the quartos, several extremely rare pre-Shakespearean Interludes and Morality Plays, first editions, specimens of binding by the Mearnes, Eve, Derome, Reynes, and others, several good items of Americana, etc. The four folios are the property of H. S. Buckley, the first being No. XIX. of Sidney Lee's census. It is perfect, that is, no leaves are lacking, but it is inferior to the Van Antwerp copy, which recently brought £3,600. The leaf of Verses preceding the title is margined all around, though all original matter is present except a comma point. It was sold by the fourth Earl of Gosford, in 1884, to Toovey the bookseller, for £470.

The Second Folio, 1632, the ordinary imprint "for Robert Allot," was formerly Frederick Perkins's copy. The Third Folio is an exceptionally fine copy of the earliest issue, dated 1663, measuring 13¼ by 8⅞ inches, and is in the original calf binding. In this issue the portrait is printed directly on the title, the verses being on a leaf facing. Although logically the seven additional plays "never before printed in folio," do not belong in this 1663 issue, they are found in the Buckley copy. The Fourth Folio is large (14¼ by 9¼ inches), and in the original calf binding.

The collection of Early English Plays, sold as "the property of a nobleman," includes the finest collection of Shakespeare quartos offered in many years. The three rarest are the following: "The Merchant of Venice," with imprint "I. R. for Thomas Heyes," 1600; "King Lear," with imprint, "Printed for Nathaniel Butter, and are to be sold at his shop in Pauls Church-Yard at the sign of the Pide Bull neere St. Austin's Gate, 1608" (this is known as the "Pide Bull" edition to distinguish it from another edition of the same date with shorter imprint; the latter is comparatively common, but no copy of the "Pide Bull" edition seems to have come upon the auction market for more than fifty years); "The First Part of the Contention betwixt the two famous Houses of Yorke and Lancaster," 1594, the first edition of the foundation play of Henry VI., Part II. (no copy has, apparently, been sold since Heber's, which brought £64 in 1834, and is now in the Bodleian).

Correspondence.

LEONARDO'S EARLY WORK.

To the Editor of The Nation:

Sir: In the course of an observant account of the changes which are making in the Uffizi galleries, your Italian correspondent, in your issue of April 25, has expressed an opinion upon the authorship of one of the most famously disputed pictures in the world, the Annunciation, attributed to the young Leonardo da Vinci. He thinks that it truly is—in part at least—an early Leonardo. Neither early Leonardos nor critics who believe in them are as plenty as huckleberries, so that your correspondent's view of this matter, considering the very modern and radical tone of his criticism of the recent arrangements in the Uffizi, is comforting to one who has always believed that the young Leonardo is in evidence as a painter, even in his apprentice days.

In the Annunciation of the Uffizi the very divergences of critical opinion have indicated an unusual and problematical work. No Italian picture indeed has excited more controversy or exhibited so curiously the possibilities of expert aberration. The cautious Cavalcaselle's absurd attribution to Ridolfo Ghirlandajo was seriously argued for on technical evidence by Morelli. Bernhard Berenson, while skeptical as to Leonardo's authorship, recognized fully the significance of the picture as a work of art, especially in its marvellous landscape, and by a confident attribution to Verrocchio reduced the problem to its lowest terms. While a few critics may still believe with Mündler that the microscopical Di Credi was capable of such subtile and eager complication in his early years as the execution of this work exhibits, the orthodox view is now that of Berenson, as developed in such an argument as Miss Maud Crutwell offers us in her able book on Verrocchio. It is indeed strongly urged that Leonardo as we know him in his universally acknowledged work resolves and remakes so completely the formulas of the early Renaissance that we must put the Annunciation into another species and type—that the gulf between it and such a modern interpretation of the theme as the little Annunciation in the Louvre can only be bridged by the assumption of a distinct artistic personality. The Louvre Annunciation is obviously a derivative of the Uffizi prototype; but in the former work the high Renaissance has found its stylistic emancipation, whereas the latter is still a mediæval survival.

This entirely reasonable argument, so far as it goes, fails to consider two facts upon which the believers in a very early phase of Leonardo's art rest their case. In view of the importance of the Uffizi picture, whether Leonardo's or Verrocchio's, and the scientific interest it must excite as a test of the principles and methods of art *expertise*, I may be allowed a little space in the *Nation* to outline the argument which will, I think, tend to confirm your Italian correspondent in his rather bold expression of opinion. One fact which the historian of art must always keep in mind in a problem of this sort is that in direct proportion to the power of original initiative in an artist, purely formal and stylistic criteria of authorship must yield to intrinsic and spiritual characters. It is precisely the most gifted men who in their eagerness to learn all that they can learn of the language of their art may most closely imitate the style of their masters. It is notorious that the great problems of connoisseurship in the Italian field turn on the relation of master to scholar. Exactly where Giotto begins in the works in the Upper Church at Assisi—where in universally accepted examples the types of Christ, and of angels, and the actual executive formulas are still of the mediæval Roman style—is the crucial problem in Giotto connoisseurship. Exactly what is Masaccio and *not* mere Masolino divides the best expert opinion. Exactly how and where the early Botticelli emerges in Lippi's atelier must perplex Mr. Berenson and Mr. Horne, I fancy. Exactly where Titian emancipates himself from Giorgione's influence is a matter of dispute—as the Pitti Concert, where the technical evidence is destroyed by repaints, and certain portraits, prove. Wide apart as are Duccio the dainty, and Cimabue, the passionate, majestic realist of the Assisi Crucifixion and the portrait of St. Francis beside the Madonna of the Lower Church, they seem almost to merge in the Ruccellai altarpiece.

And so with Leonardo and Verrocchio. As Mr. Horne in his illuminating notes to Vasari's "Leonardo" well says, the traditional account of Leonardo's participation in the execution of the Baptism of Christ can scarcely be a mere fable, owing to Vasari's unusual reliability in this "Life," and yet in its general formal style how far from a Leonardesque ideal is the still literal metal worker's rendition of a traditional scheme, copied, indeed, in its compositional motives from such a timid work as that now generally agreed to be Baldovinetti's! Yet competent critics insist that behind the austere and even labored if tonic and masterly forms of Verrocchio's Baptism is a landscape artist of the first rank finding a new expression of large elemental effects, grasped and interpreted in Giotto's and Masaccio's spirit, rather than in any literal naturalism, such as we see in the ordinary backgrounds of the early Florentines—in Baldovinetti, in Antonio Pollaiuolo, in Ghirlandajo. It is clear that the acceptance or rejection of the theory that this noble background and much of the execution of the Baptism is by Leonardo himself at about the time of his wonderful landscape drawing in the Uffizi of 1473—a theory which I must accept as highly probable—does not depend upon Morellian norms or upon any external stylistic evidence whatsoever, but upon a larger qualitative judgment and comparison.

In the case of the Annunciation the composition, an awkward and disjointed one, without complication or *dénouement* in its figurative scheme, in its foreground accessories and even in the conventional middle distance, may well be of Verrocchio's inspiration, or even from his actual design; and yet the true virtue of the picture is that it is perhaps the first attempt in modern art to interpret concretely and with poetic insight the beauty of a meteorological immanence, as it were—the effects of the summer afternoon light and the heat-mists of the Arno Valley at play in the foliage. We see also the emancipation of the artist's vision and the freeing of the artist's hand and the variation of his palette as he passes behind his formal parapet and trees to the open country and the distant hills, ever broadening his intervals and simplifying his thematic material in the fashion of the great landscape poets. This virtue, first, I think, fully recognized in Mr. Berenson's acute criticism, is the essential beauty of the work to those who can see at the time no other master than Leonardo capable of the same power and the same unifying, sympathetic, and *ideal* grasp of an objective theme. Believers in Leonardo's authorship see in the master's later work the same creative spirit of landscape painting as a fundamental element in his style, and are not perplexed with the incidental awkwardness, the somewhat overstudied, and even niggling character of the more conventional features in the picture. These have their counterpart in the Vierge aux

Rochers—in norms of over-elaborated draperies and excessively painstaking draughtsmanship—for that matter. I may say that the hand of the Virgin in the Annunciation is a fellow to that hand which supports the infant St. John in the Louvre experiment in chiaroscuro. We admit, nay we claim, a slow stylistic development in Leonardo.

The material evidence for the correctness or incorrectness of your correspondent's opinion—and mine—is, of course, technical. A jury of competent artists could by a consensus one way or another decide the question quite finally; but so far as I know no adequate technical analysis of the possible early paintings of Leonardo has yet been published. Artists would greatly help art historians by such observations. I may say in conclusion, that no art historian has yet adequately considered the technical evidence, and that I do not agree with your correspondent as to the frightfully damaged condition of the foreground of this picture. There are abundant passages in the foreground which in my opinion are as free from repainting as is the landscape. Moreover, I think the picture is certainly by a single hand, and by a young man.

The secret of Leonardo's landscape art—the greatest of Italy, perhaps, because more real and objective than Giorgione's—is revealed at once to the visitor to Vinci, where the vision of the Carrara Mountains and the Pistoian Apennine over lowlands, burned into the inspired boy's mind a sense for those large atmospheres and spatial values which have no counterpart in the work of any Florentine masters of the time, although prefigured in Giotto and Masaccio. At Milan the same conditions obtain upon a larger scale in the marvellous panorama of the Monte Rosa group, and with the background to the Monna Lisa everything essentially modern in landscape synthesis is completely developed and expressed by the master. The objective character of this type of work is not generally recognized perhaps, but that is simply because people do not generally know Italy in the summer. It is recognized by critics of the calibre of Mr. Fry, and is indeed obvious to the lover of Italian nature, although strangely unobserved by Ruskin, who, by the way, believed in the Annunciation. WILLIAM RANKIN.

Richmond, Mass., April 26.

STUDENTS IN WESTERN UNIVERSITIES.

TO THE EDITOR OF THE NATION:

SIR: The newspaper press has given wide circulation to certain portions of a recent address by President Hadley of Yale, in which he is alleged to have said, among other things, that the student constituency of the Western universities was extremely provincial and local as compared with that of the colleges in the East. It is entirely possible that President Hadley has been incorrectly quoted, but a few facts concerning the issue mentioned may be of interest. President Hadley is said to have referred especially to the State universities, and it occurred to the writer to compare the conditions at Yale with those at the University of Michigan, which is the prototype of the Western State universities.

By the latest catalogues to which I can obtain access (Yale, 1905-6; Michigan, 1906-7), Michigan had in attendance 4,836 students, Yale 3,808. Both institutions had representatives from forty-eight States and Territories of the United States proper. Of our outlying dependencies Michigan had representatives from three, Yale from two. Of foreign countries and provinces Michigan had on its list seventeen, Yale sixteen. Judged by these figures, the Eastern institution is at no advantage either as regards its national or its international character.

Of the total student body at Michigan somewhat over half come from the State of Michigan. At Yale about one-third are from Connecticut. However, if one were to take for comparison a territory as large as the State of Michigan, it would be found that the Michigan attendance is quite as scattered as that at Yale. Nor is the disparity at all so marked on sectional lines as one might imagine. Yale has 188 students from Pennsylvania, Michigan 181. From New York Yale has 603, Michigan 299. From Ohio Yale has 135, Michigan 408. From Illinois Yale reports 147, Michigan 315. There are at Ann Arbor 76 students representing in their number every one of the New England States.

It may be maintained that Michigan is exceptional among Western institutions. But an exactly similar condition of things exists at the University of Chicago, although this is not a State institution. The truth is, of course, that certain colleges in the East, like certain others in the West, have a constituency almost wholly local in make-up. But there are several Western universities whose constituency is quite as cosmopolitan as that of their Eastern rivals. JAMES R. ANGELL.

Chicago, May 2.

THE PEACE CONFERENCE.

TO THE EDITOR OF THE NATION:

SIR: There is a plan that would conduce to international peace much more certainly than the limitation of armaments, but it was not alluded to at the Peace Conference in New York. None of the great Powers believes that it has yet completed its necessary defensive armament, and it is futile to expect this subject to be discussed at The Hague.

But probably all the Powers would welcome a discussion of their respective political spheres of influence, if it were conducted in a proper spirit. Every Government has ambitions to gratify, but still more imperative are its needs to provide for the expansion of its commercial enterprises and the material advancement of its people.

It is evident that a rapidly growing State must have room to extend, and therefore its political horizon must be gradually pushed farther off. If, therefore, agreements can be made between the Powers that meet at the Hague, defining their respective spheres of influence for the next fifty years, a great step will have been taken in the direction of universal peace.

The United States has asserted the Monroe doctrine, which is a definition of its sphere of influence over North and South America. England and France have delimited their spheres, one covering Egypt and the other Morocco. Chile and Argentina have made peace by settling their frontiers. And probably Germany and France might avoid the constant tension of war preparations if France would agree to limit her Mediterranean sphere to the east line of Tunisia, while Germany would have a free hand in Asia Minor, so far as France and England are concerned. These political spheres would not involve a commercial monopoly. Other nations besides Germany could build railroads and obtain concessions in Germany's sphere, and Germany and others could operate industrially in Morocco. It is not in reason that a powerful and populous empire like Germany can consent to be circumscribed in its commercial expansion. If the nations are willing to be fair and reasonable at the coming conference, and take up this matter of spheres of influence in a mutually considerate spirit, the peace of the world for a long time to come may be there assured.

Fort Wagner, Ind., May 4.

FATHER DE CARA.

TO THE EDITOR OF THE NATION:

SIR: Commenting upon Mr. Super's letter in the *Nation* (April 18), allow me to state that there are no less than sixteen references to Father De Cara and his Hittite-Pelasgian theories in the index of the second volume of my "Chronique d'Orient." Mr. Super may also find a biography of De Cara by myself in the *Revue Archéologique*, 1906, i., pp. 342-3. Italian savants have been only too much influenced by him. De Cara's etymologies are mostly beneath criticism, and impair the interest of his otherwise learned and readable books. A few years before his death, one of the directors of the German Institute in Rome wrote that scientific criticism would have to be struck dead (*totgeschlagen*) before the etymologies of De Cara could be admitted or even discussed. The German scholars seem to have taken that severe phrase quite literally, and it is true that they almost all ignore the big books of laborious De Cara.

SALOMON REINACH.

Paris, May 2.

Notes.

Harpers this week bring out a life of Charles A. Dana, the journalist, by Gen. James H. Wilson.

Mitchell Kennerley has almost ready "Lord Beaconsfield and Other Tories," by T. E. Kebbel. The other Tories are Salisbury and Lord Randolph Churchill.

The Frederick A. Stokes Company is bringing out three books on hygiene: "The Nutrition of Man," by Prof. R. H. Chittenden; "The Art of Living in Good Health," by Dr. D. S. Sager, and "Worry," by Dr. C. W. Saleeby.

Scribner's this month will publish "The Militants: Some Stories of Parsons, Soldiers, and Other Fighters in the World," by Mary R. S. Andrews; "The Voyages of Samuel Champlain," by W. L. Grant; "Social and Religious Ideals," by A. J. Haynes; and "The British City," by Frederic C. Howe. The same house will soon have ready a translation of the "Memoirs

of the Comtesse de Bolgne," reminiscences of the Revolution, Empire, and Restoration that have gone through five editions in France in as many weeks.

E. P. Dutton & Co. announce the following books: "The Churchman's Treasury of Song," by J. H. Burn; "The Pyrenees," by S. Baring-Gould; "The Outlook in Ireland," by Lord Dunraven; "Submarine Warfare," by H. C. Fyfe; "The Life of St. George," by E. O. Gordon; "The Brasses of England," by H. W. Macklin; "The Future of Japan," by W. P. Watson; "Essays," by A. C. Benson; "Blake," by Arthur Symons; "The Parish Clerk," by P. H. Ditchfield; "Russia and Reform," by Bernard Pares, and "The Evolution of Life," by H. C. Bastian.

We have in hand a letter from T. Sano, chief librarian of the Yamaguchi Public Library, Japan, telling of the encouragement by the Government to the extension of public libraries in the various prefectures, and the quick response to this action. In general, the idea of library promotion there seems to be modelled closely after that followed by the State library commissions in this country, including both a personal propaganda and material aid. The travelling library has been specially developed, both as an aid in encouraging the founding of local libraries, and as a supplement to the resources of small public and school libraries. In the prefect of Yamaguchi, twenty-nine local libraries have been established in about two years, and a travelling library system created which now numbers 1,648 volumes. The travelling libraries are sent out in both fixed and flexible groups, according to the needs of the community. Last year they reached a total circulation of 10,227 volumes. With a generosity that goes beyond that of any of our States, save California, the travelling libraries are sent entirely free of cost to the recipients.

In the *Geographical Journal* for May Capt. Roald Amundsen gives an interesting account of his daring voyage for purposes of magnetic research in the region of the north magnetic pole, leading eventually to the first accomplishment by any vessel of the famous North-West Passage. Considering that the Gjöa was probably the smallest vessel ever navigated in the Arctic, and that the crew consisted of only seven men, it was a remarkable exploit. The story of the voyage is simply told, and contains many interesting facts in regard to the Eskimos, including an account of the manner in which they built their snow huts. He describes minutely his method of taking magnetic observations, his fourteen magnets being "kept going day and night, without interruption for nineteen months." It will take years to get his observations into form, and they will show where the magnetic pole is for one epoch, but there is still some doubt as to whether it is a fixed point or not. The results of a personal investigation of the Cutch and the Ran, a part of the delta of the Indus, are given by Mr. R. Sivewright. He shows how great has been the encroachment of the land upon the sea since the time of Alexander the Great, "very great changes having taken place during the past eighty years," but he is not certain as to all its causes, whether in addition to the silt brought down by the river and the action of the monsoon, there might not have been some upheaval of the sea bottom. The Rev. J. Hedley describes briefly au exploration of the higher reaches of the Lao Ho River in Inner Mongolia, a region never before surveyed by any foreigner, and extracts are given of a letter from Dr. Sven Hedin telling of his journey through Tibet to Shigatse, where he was received by the Tashi Lama "with really kingly hospitality."

In *Petermann's Mitteilungen*, number three, Ernst Herzfeld narrates the principal incidents of a journey southward from Bagdad through western Persia. The geographical features of the country traversed are described in detail, and some interesting facts are given in regard to the people of a region rarely visited by travellers. This is largely owing to the constant tribal feuds, which make travelling difficult and dangerous. Large tracts of fertile country, formerly thickly populated, are now deserts with a few nomad inhabitants. Near the Turkish frontier he met dally large bands of pilgrims who were carrying the bodies of their dead to the Shiite Meccas, Kerbela and Nejef. The editor, Dr. Supan, contributes a chart with explanatory notes showing a remarkable submarine chasm, 23,100 feet deep [7,000m.] in the Indian Ocean south of Java and known as the Sundagräben.

The Turfan expedition in chargé of Albert v. le Coq has brought back a number of important manuscripts. Some of them contain portions of the New Testament writen in the now extinct Sogdhlan language, spoken by the inhabitants of the ancient Soghdiana, between the Oxus and the Jaxartes. A comparison with the New Testament is confidently expected to furnish the key for the understanding of this lost dialect. It will doubtlessly also explain the mysterious Soghdian documents discovered some time ago in Manichæan writing. Prof. F. W. K. Müller has discussed this new find in the reports of the Berlin Academy of Science, 1907, p. 260-270.

The Eighth International Agricultural Congress has been called to meet in Vienna during the last week of the current month of May. Over one thousand announcements have been received and practically all the civilized peoples of the globe will be represented. The Austrian railroads will grant special reductions.

When Prof. Niels R. Finsen died in Copenhagen a commission was at once selected to solicit funds from all nations to erect a memorial to that brilliant scholar. It is now reported that the collection amounts to the handsome sum of 50,000 kronen for the monument, and that a surplus is at hand large enough to establish a Finsen scholarship. Out of some thirty plans submitted of a monument, the award was given to Rudolf Tegner, a young Danish sculptor. The latter has been instructed to prepare his work at once.

The *Allgemeine Zeitung* of Munich (Beilage No. 14-15) publishes the details of the new copyright law, which the Russian Department of Justice has prepared for submission to the Duma, and the adoption of which is confidently expected. It is an elaborate scheme, and covers all works of literature, art, music, photography, and the like. One of the chief stumbling blocks in the past to the establishment of a full international copyright agreement has been the unsatisfactory laws in this respect in Russia This evil is fully remedied by the new law, which particularly stipulates that foreign works of literature and art can be reproduced in Russia only in harmony with the agreement which the State may make with other nations on this subject. To its own subjects Russia proposes to be liberal in granting the copyright, in ordinary cases the exclusive control over a publication being given to the heirs of an author for fifty years after his death. The right to the translation of a work is the author's for a period of ten years.

The Bostonian Society has published in its annual proceedings an address of more than merely local interest delivered at the twenty-fifth anniversary of its foundation by Edwin D. Mead. His subject was the poets, Longfellow, Emerson, Lowell, Whittier, and Holmes, having special reference to what they wrote of Boston and Boston worthies. The numerous quotations from their poems and the personal incidents narrated show how "they wrote themselves into the history of Boston in the momentous period in which their lives were cast, and their burning verses are a cardinal part of the authentic record." A good suggestion is that some worthy monument should be reared to this great group of poets who, with the contemporary prose writers, Bancroft, Prescott, Motley, and Parkman, make the time in which they lived our "golden age."

It would be obviously unfair to apply very exacting standards of historical criticism to such a work as Mrs. Roger A. Pryor's "The Birth of the Nation" (Macmillan); for while the memorable story of the establishment of the Virginia colony still bristles with difficulties, the aim of the book, notwithstanding its evidences of reading in the better-known sources, is frankly popular, not critical. It is distinctly a book for the moment, quite evidently written for the benefit of visitors to the Jamestown Exposition, and not free from the repetitions and trivialities which suggest haste. Those persons, however—and they are doubtless many—who feel moved to seek a pleasantly written sketch of the Jamestown episode, wtih ample emphasis on its romantic and painful incidents, and with the veritable figures of John Smith, Powhatan and Pocahontas greeting the reader at almost every turn of the page, may safely be directed to Mrs. Pryor's agreeable book.

We confess to a feeling of depression and insufficiency in the presence of such books as "American Problems," by President James H. Baker of the University of Colorado (Longmans, Green & Co.). Of the papers and addresses collected under this title, a number, we are told, have done duty on commencement and other occasions, and designedly emphasize tne ethical aspects of citizenship and politics; while the variety of subjects ranges from Wendell Phillips and Phillips Brooks to electives in secondary schools and an American university at Washington. President Baker's observations are in general so true and obviously well intentioned, that it is hard to adjudge them unworthy of a permanent form; but the most friendly judgment cannot claim for the papers any originality, or point to any

passage particularly worth a second reading. The only distinction of the book is its style, which has a crispness and vigor that many readers, especially such as are neither thoughtful nor well read, will doubtless find attractive.

As a tribute to the memory of the late Prof. Bernhard Stade, professor of Old Testament exegesis at the University of Giessen, who died on the 6th of December, 1906, the publisher, Alfred Töpelmann, has issued a second edition, at the almost nominal price of two marks, of his selected discourses and essays, under the title of "Ausgewälte akademische Reden und Abhandlungen" (Giessen). Dr. Stade was, next to Wellhausen, the most noted of Old Testament critics of his day. He enjoyed the rare distinction of having produced a standard Hebrew grammar, a standard Hebrew dictionary, and the most significaut and comprehensive work on the history of Israel on the basis of the results of the moderu critical study of the Old Testament. His death at the early age of fifty-eight years was a serious loss to German scholarship. But his interests were not limited to the claims of the specialists. He recognized the important bearings of Old Testament studies on the various problems of the day, and four of the essays included in this volume touch very closely on these problems. They are as follows: (1) The State of the Protestant Church in Germany; (2) The Messianic Hope in the Psalms; (3) The Scope of Biblical Theology of the Old Testament; and (4) The Origin of the People of Israel. These addresses, delivered either on public occasions at the University of Giessen or before church assemblies, form a notable contribution to the subjects of which they treat. The remainder of the volume is taken up with investigations of a more special character, such as the narrative of Solomon's building operations, the mark of Cain, the tower of Babel, and notes on important passages in Kings, Numbers, and so forth. Of these special investigations, the one on Cain's mark is perhaps the most significant, for it proves the current explanation of the mark placed on Cain's forehead, that it was to brand him as a criminal, to be unwarranted. The mark was a tattoo having a religious significance, and indicated that the one so branded belonged to the community of Yahweh worshippers.

The criticism of D. C. Calthrop's "English Costume" (The Macmillan Co.) must depend on the point of view of the critic. As a book of reference it loses half its value from the absence of an index; as a serious history of clothes it suffers from the author's attempt to be sprightly; as a book of entertainment it is too learned. From any special point of view, that is, the book cannot escape partial condemnation; yet, taken as a whole, as a work at once moderately entertaining to read and moderately useful for study, it may serve a purpose. Mr. Calthrop follows the changes of costume from the Conquest down through its vagaries to Beau Brummel, "who raised the level of dress from the slovenly, dirty linen, the greasy hair, the filthy neck-cloth, the crumpled collar, to a position, ever since held by Englishmen, of quiet, unobtrusive cleanliness, decent linen, an abhorrence of striking forms of dress." It is worth while to read the book, if only to get this truer notion of fat George IV.'s friend. Mr. Calthrop is artist as well as writer, and each period is illustrated by full-page colored plates, besides a number of smaller cuts. The pictures are in themselves brilliant pieces of color, well printed. It is a strange light on history one gets by turning these pages. Of all times Queen Elizabeth's was the most artificial and the most grotesque; and the view of this motley and barbaric garb is a striking comment on much of the literature of the period. We have intimated that for most tastes a plainer style with less effort to be vivacious would be more agreeable. At times, it must be admitted, Mr. Calthrop succeeds in presenting a brisk scene to the eye, as in the story of Queen Elizabeth under the hands of her maids, with its conclusion:

> So in this manner the Queen struts down to posterity, a wonderful woman in ridiculous clothes, and in her train we may dimly see Mr. Higgins, the tailor, who named a street without knowing it, a street known in every part of the civilized world; but, nowadays, one hardly thinks of connecting Piccadilly with a lace ruff.

We noticed on April 4 a reprint of some of the theological essays of the late Benjamin Jowett, entitled "The Interpretation of Scripture and Other Essays." Another volume of the writings of the late master of Balliol, entitled "Scripture and Truth," and including also the famous essay, "The Interpretation of Scripture," has been edited by Lewis Campbell. This has been issued by Henry Frowde, well printed, and in convenient form. These publications, it may be hoped, indicate wide current interest in Jowett.

The last edition of "The Seven Sages of Rome" was published more than sixty years ago. The text is an important one in the history of stories and a new edition was obviously needed. This want has just been supplied in a thoroughly satisfactory manner by Prof. Killis Campbell of the University of Texas, in the Albion Series of Anglo-Saxon and Middle English Poetry (Ginn & Co.). Professor Campbell's well-known dissertation on the subject had marked him out as the person who was best qualified to undertake this task, and the result does not disappoint expectations. The text of this edition is based on the Cotton manuscript (early fifteenth century), the variants of a closely related manuscript in the Rawlinson collection, at Oxford, being given in the footnotes. The remaining seven manuscripts, moreover, are carefully described and the particulars in which they differ from the Cotton-Rawlinson redaction noted. Of especial interest are the sections of the Introduction, which deal with the various versions of these stories, both in the Orient, where the collection originated, and in Europe. Thus of the "Widow of Ephesus" (best known through Petronius), there are seventy-six versions recorded in the list of Originals and Analogues. The parent Middle English version of "The Seven Sages" seems to have been Kentish and was probably composed towards the end of the thirteenth century. The editor, however, is perhaps wise in rejecting the opinion of the late Professor Koelbing, who identified its author with that of the Kentish "Arthour and Merlin" and other poems. Notes, glossary, and an index of names complete the volume.

Dr. Edward Caird has been compelled by ill-health to resign the mastership of Balliol College. Dr. Caird was elected Professor Jowett's successor in 1893, having been Fellow of Merton College and Professor of Moral Philosophy at Glasgow. The new election will take place June 5.

PROFESSOR RALEIGH'S SHAKESPEARE.

Shakespeare. By Walter Raleigh (English Men of Letters.) New York: The Macmillan Co. 75 cents net.

It is interesting to speculate on the reasons which prevented Mr. John Morley, as editor of the original English Men of Letters, from including a volume on Shakespeare. Whatever they were, the absence from the list of the greatest name of all has been in a way impressive, constituting a tribute inferior only to the writing of a monograph by a critic of appropriate calibre. Thus the appearance of this volume by the Professor of English Literature at Oxford implies a challenge more than usually daring. The dignity of the subject, the long delay in the assignment of the task, the official position and previous achievements of the author, combine to justify the forming of great expectations.

It may be said at once that these expectations are, on the whole, not unworthily fulfilled. The style is often charming, sometimes eloquent, nearly always brilliant. The pages are sprinkled with apothegms, frequently provocative but always suggestive; and the author's gift of quotation is something to be envied. His familiarity with the text is all but absolute; his appreciation acute and discriminating. The great matters of dispute he handles with sanity and moderation, if not always with decision. On the other hand, the book is not well constructed; and, throughout, the author's strength lies rather in stimulating comment than in logical inference. Thus, as an example of ill-construction, it may be noted that the discussion of all the plays, save the three dramatic romances, is huddled into a single chapter on "Story and Character," within which it is difficult to find order or method. Instances of faulty logic are scattered throughout the volume. In the biographical chapter, in which as elsewhere no attempt is made to add to our knowledge of facts, there is more than enough of unbased and futile conjecture. It profits us nothing that Professor Raleigh thinks John Shakespeare "may well have been excitable, sententious, and dogmatic" in speech, since evidence on the point is absolutely lacking. Why trouble to "guess him to have been of mercurial temperament"? Does Professor Raleigh really believe that William Shakespeare's "unerringly sure touch with the character of his high-born ladies" is in any sense due to an alleged descent from "Guy of Warwick and the good King Alfred"?—"Oh, gentlemen, the time of life is short!"

Subtler and more serious flaws in reasoning occur in the critical chapters. In arguing about the autobiographical elements in the Sonnets, he says: "If the events had no existence, and the sonnets are semi-dramatic poems, it is surely es-

sential to good drama that the situation should be made clear." But "semi-dramatic" and "good drama" are not equivalent terms; and, unless they are, his argument is void. Again, in the same connection, we find: "That they were made from the material of experience is certain; Shakespeare was not a puny imitative rhymster." No one says he was puny or a rhymster; we all know he was imitative, and in Mr. Lee's argument which Raleigh is here opposing it is the fact and not the quality of imitation that is in question These instances exemplify the author's besetting logical sin: he throws in an irrelevant adjective, then, in demolishing that, assumes that he has destroyed the argument based upon those essential elements in the sentence which remain untouched.

In the discussion of the Sonnets as a whole, while he says several wise and penetrating things, he does not seem to us to have advanced the solution of the matter perceptibly. He comes perilously near making shipwreck in his use of the treacherous word "sincere." There is no antithesis between "dramatic" and "sincere." Hamlet's speeches to his mother are in no sense lacking in sincerity; but they are thoroughly dramatic, and no one has suggested that Shakespeare was ever moved to speak thus to Mary Arden. The difficulty here, as usually in this controversy, is in the assumption that all the sonnets stand or fall together. There are sonnets in Shakespeare's volume so artificial that they may well enough be such imitative exercises as Mr. Lee would make them all. There are others that from the nature of the subject, and the kind and intensity of feeling, will probably always convince the non-partisan reader that they have sprung directly from personal experience. But the real greatness of these poems is due after all to the same cause as gave supreme distinction to Shakespeare's dramatic productions—the intensity of the imaginative fervor of an essentially poetic mind.

While not ill-informed, this volume is not distinguished for the use made of recent scholarship. It shares with Professor Bradley's recent work the defect arising from an insufficient attention to theatrical conditions, the plays being treated constantly as books, not as materials for acting. A typical result of this appears in the author's preferring Plutarch's account of the death of Cleopatra to Shakespeare's superb scene, than which there is scarcely anything greater in literature. Had he accustomed himself more to the visualizing of Shakespeare's scenes, he would not find wanting here the effect of Plutarch's "moving little touches of description." Again, his statement, "Nor is there reason to suppose that the public called at one time for comic stories, at another time for tragic, and that [Shakespeare's] plots were adapted to suit the demand," would hardly have been made thus absolutely had he weighed the contributions to dramatic history made by Wendell and Thorndike.

In the estimate of individual characters, there will always be diversity of opinion; but we fancy few careful students will agree that in "Hamlet" Osric is drawn with "loving care," whereas the King is "little better than a man of straw." This last view is partly due to exaggeration of the caution on which the author insists, that one should be careful to view secondary characters in relation to the hero. More serious is what seems to us the limitation of his view of the place of character in affecting the course of the action. He seems to think that there is no middle way between regarding the catastrophe as entirely determined by the character of the hero, or as entirely determined by Providence or Fate or Fortune. But Bradley has admirably pointed out the truth to life in Shakespeare's blending of these two forces, showing how the outcome could be what it is only by such and such a character in interaction with such and such external accidents. With this limitation is connected a curiously narrow view of the meaning of "morality." "There is no moral lesson to be read," Raleigh says, "except accidentally, in any of Shakespeare's tragedies. They deal with greater things than man: with powers and passions, elemental forces, and dark abysses of suffering"—and so on. Does, then, morality have nothing to do with the conduct of man under the pressure of powers and passions?

We have said that no attempt is made to add to our knowledge of facts. One exception should be noted. An interesting line of study is suggested and excellently exemplified in the search for what might be called the non-literary sources of Shakespeare. From books like Harrison's "Description of England," Greene's "Second Part of Connie-Catching," and Lord Burghley's correspondence, he gathers descriptions of fashions and incidents which help us to reconstruct the daily pageant that passed before Shakespeare's eyes. The other contributions are chiefly of the nature of interpretations; and, in spite of the considerable number of differences of opinion we have set down, the bulk of the book forms a brilliant essay upon selected features of the dramatist's work. Viewing it thus, we have no right to insist on such omissions as that of all consideration or appraisal of Shakespeare's verse, or to criticise the volume as if it were meant to be compendious. It is in no sense a handbook or a detailed, critical biography, but a stimulating account of the reaction of Shakespeare's creations upon a keen and sensitive mind, recorded by a master of style.

LEA'S HISTORY OF THE INQUISITION.

A History of the Inquisition of Spain. By Henry Charles Lea, Volumes II. and III. Pp. xi, 603, xi, 575. New York: The Macmillan Co. Each $2.50 net.

The second and third volumes of Mr. Lea's monumental work, following close upon the account of the origin and establishment of the Holy Office contained in the first volume, are devoted to a careful analysis of the structure and workings of the Spanish Inquisition, as seen in its organization, resources, jurisdiction, procedure, and punishments, and in the various spheres of its activity. The author keeps the larger aspects of the subject well in mind, and is not afraid to generalize at the proper time, but he is in accord with recent tendencies in institutional study in striving to be as concrete as possible and to show the real nature of the Inquisition by the specific detail which makes clear its actual operations. This illustrative detail, however, is not chosen for sensational purposes; the treatment throughout shows the qualities of sobriety, steadiness, patience, and candor which we have come to expect in Mr. Lea's work. Rarely has so significant an institution been so sanely and comprehensively studied, and rarely has the reader been placed in so good a position to observe its workings and draw his own conclusions from the evidence presented.

To most readers the interest in these volumes will centre in the account they give of the procedure of the Inquisition and the penalties imposed upon its victims. At the outset the law which the Holy Office administered was not of its own creation, but a system inherited from the papal inquisitors of the thirteenth and fourteenth centuries. This the Spanish tribunal modified and elaborated as time went on, sometimes in the direction of greater severity, but often on the side of leniency and justice. Its methods have generally been judged, and condemned, by the application of modern or abstract standards, and it is one of Mr. Lea's signal merits as an historian that he studies them in the light of their origin and of the secular jurisprudence of their time—a task for which he is peculiarly qualified by the wide acquaintance with the history of European law which was made manifest many years ago in his "Superstition and Force." Thus nothing is more repellent to the modern mind than the judicial use of torture; and when we shudder at its prevalence under the Inquisition, we are apt to forget that it was regularly employed in the secular courts of most European countries until the close of the eighteenth century. It had been a well recognized instrument of the mediæval inquisitors; the Spanish tribunals restricted rather than extended its use, and as a rule were "less cruel than the secular courts in its application." The system was bad enough, even within these limits, as the instances given by Mr. Lea (*e. g.* Vol. III. p. 24) prove, but "the popular impression that the inquisitorial torture-chamber was the scene of exceptional refinement in cruelty, of specially ingenious modes of inflicting agony, and of peculiar persistence in extorting confessions, is an error due to sensational writers who have exploited credulity."

The special methods of procedure also, the so-called "inquisitorial process," while they originated in the inquisitorial tribunals of the thirteenth century, had passed into general use in secular courts, but they were not there carried on amid the inviolable secrecy which surrounded all the operations of the Holy Office. No one was allowed to know its methods—hence the barrenness of Spanish literature on the subject of inquisitorial practice, in contrast to the abundance of Italian works on the subject—and one who entered its prisons "disappeared as utterly as though the earth had swallowed him." The Inquisition "framed its own code and administered it in darkness," and in an age when "the secular courts, though open to the public, were little better than instruments of oppression and extortion," it was not to be expected that its secret tribunals

should be either scrupulous or merciful.

Mr. Lea continues:

Yet, whatever we may think of the morality of the inquisitorial process, there can be no doubt as to its efficacy. In studying the long and minute records of the trials, where every detail is set forth in writing, it is instructive to see how often the accused, who boldly commences by asserting his orthodoxy, comes in successive audiences to make some admission of which advantage is skilfully taken and gradually the denial breaks down, or perhaps yields to the terrors of the accusation and the publication of evidence, ending in complete confession and eager implication of kindred and friends. The situation of the accused, in fact, was helpless. Standing up alone before the stern admonitions of the trained and pitiless judge; brooding in his cell, cut off from all external communication, during weeks and months of interval between his audiences; apparently forgotten, but living in the constant uncertainty of being at any moment summoned to appear; torturing his mind as to the impression which his utterances might have made, or the deductions drawn from his admissions or denials; balancing between the chances of escape, by persistent assertions of innocence, and those of condemnation as an *impenitente negativo*, and urged by his so-called advocate to confess and throw himself on the mercy of the tribunal—it required an exceptionally resolute temperament to endure the prolonged strain, with the knowledge that the opponent in the deadly game always had in reserve the terrible resources of the torture-chamber. The whole course of the procedure was based on the assumption that the accused was guilty; that it was the province of the tribunal to induce or compel him to confess his guilt, and in the great majority of instances the assumption was correct. To those who regarded aberrations from the faith as the greatest of crimes before God and man, and their punishment as the most acceptable service that man could render to God, this presumption of guilt served to justify the cruelty of the procedure and the denial of all facilities for defence which, to those trained in the principles of English justice, seem the imprescriptible right of the accused, whether innocent or not.

After conviction or confession had been secured, Mr. Lea finds that the Spanish Inquisition "was not systematically and ferociously cruel as has so often been asserted." Yet it was more merciless than its mediæval predecessor in the work of extermination. It added new penalties, like the gag and the galleys, and it employed the stake, as a foretaste of the unquenchable fire of the world to come, not only for pertinacious heretics, but also for those who repented after sentence. Such penitents, however, were frequently, as an act of mercy, garrotted before burning. It was in Spain, too, that the simpler *sermo* of earlier times was replaced by the *auto da fe*, "an elaborate public solemnity, carefully devised to inspire awe for the Inquisition, and to impress the population with a wholesome abhorrence of heresy, by representing in so far as it could the tremendous drama of the Day of Judgment." Carried out with truly Spanish regard for ceremony and display, the *auto* was considered an entertainment appropriate for a day of rejoicing or for the reception of distinguished guests, until, along with bullfights and fireworks, it became an essential part of a royal fiesta. Philip V., in 1701, was the first king to decline to be present at an *auto* celebrated in honor of his accession.

Even when its sentence was light, "the mercy of the Inquisition was more to be dreaded than the severity of other tribunals," for its smallest penalty might condemn the accused and his posterity to lasting infamy. Not only were the disabilities imposed by the canon law on the children and grandchildren of impenitent heretics construed as applying to the children and grandchildren of all condemned or reconciled by the Inquisition, but all its penances came to be considered a stigma, and this stain, like descent from one of the proscribed races, was transmitted to the remotest descendant. Meanwhile, the craze for *limpieza*, or absolute purity of blood, took hold of Spain and left its mark deep on the national life. Proof of *limpieza* came to be required for admission to the priesthood, to the colleges, to the great military orders, and to any form of employment by the Holy Office itself. The process of proof was slow and difficult, and hearsay evidence was freely admitted, so that a writer of 1629 says that "those who succeed best in the proofs are the poor peasants, whose grandparents have been forgotten, and the great nobles, against whom no one dares to testify." About 1560 Cardinal Mendoza prepared a memoir showing that virtually the whole nobility of Castile and Aragon had a strain of Jewish blood; and "no one of the upper middle class, except in the remote mountainous districts of the north and east, could feel sure that investigation might not reveal some unfortunate *mésalliance* of a distant ancestor." The result was, of course, "greatly to increase the authority of the Inquisition and the terror which it shed around it, by the fact that at a word it could inflict this undying infamy upon a lineage"; and also to increase race hatred.

Another phase of the Inquisition is brought into sharp relief by Mr. Lea in his chapter on confiscation. That the property of condemned heretics should be forfeited to the state was a principle inherited from the Inquisition of the Middle Ages, where it proved effective in securing the support of princes in whom the religious impulse to persecution was weak; and it is to the credit of the Spanish institution that it mitigated in various ways the harsh administration of its predecessor. Nevertheless, confiscation, by reason of the suffering which it inflicted on the families of the condemned, was recognized by the inquisitors "as their most potent weapon and the one most dreaded by the industrious classes which formed their chief of labor." "The enforcement of confiscation was a business matter, reduced to thorough and pitiless system." How much was realized in this way it is quite impossible to say, but the indications are that the amounts were enormous. In spite of the shrinkage resulting from the hurried sales of confiscated property and the mismanagement and peculation from which the Holy Office suffered in common with all departments of the Spanish Government, the Inquisition was enabled to pay all the expenses of its proceedings, to support its officers and subordinates in comfort, with various perquisites and special provision for their entertainment at bullfights and other festal occasions, to accumulate a large capital against the leaner days of the seventeenth century, and to pay over a large surplus to the crown. Such systematic spoliation was a heavy burden upon the productivity of the country, but this was probably the least of the economic evils to which it gave rise. As the heretic's property was held to be forfeited from the time when the first act of heresy had been committed, all his subsequent acts were accordingly invalidated, and although the older procedure was so far mitigated as to allow the collection of debts against his estate, the retroactive construction of this doctrine in other respects unsettled all business:

Trade could not flourish when credit was impaired, and confidence could not exist when merchants and manufacturers of the highest standing might, at any moment, fall into the hands of the tribunal and all their assets be impounded.

It has often been pointed out that the Jews and Moriscos whom the Inquisition drove out of Spain were economically the most valuable classes of the population. Mr. Lea is, if we mistake not, the first to call attention to the effects of the Inquisition upon credit and commercial security as contributing to the decline of Spanish commerce and industry which is one of the most striking facts of modern economic history.

The original field of activity of the Spanish Inquisition was among the *conversos* or Judaizing Christians; and the expulsion of the Jews by Ferdinand and Isabella, followed by the vigorous activity of the inquisitors during the sixteenth century, practically rooted out Judaism from Spain, except where it was reinforced by fugitives from the newly organized Inquisition of Portugal. The expulsion of the Moriscos which ensued under Philip III., an episode which Mr. Lea has recounted more fully in a special volume, threatened to deprive the Inquisition of its reason for existence, for of heresy in the ordinary sense Spain produced exceedingly little. The new life and importance of the Holy Office in the seventeenth century were the result, and the chief result, of the Protestant movement in Spain, the extent and importance of which, naturally exaggerated by the sympathy which many modern writers have felt for the fate of its adherents, Mr. Lea reduces to their true proportions:

There never was the slightest real danger that Protestantism could make such permanent impression on the profound and unreasoning religious convictions of Spain in the sixteenth century, as to cause disturbance in the body politic. . . . Spanish Protestantism was a mere episode, of no practical moment save as its repression fortified the Inquisition and led to the segregation of Spain from the intellectual and industrial movement of the succeeding centuries.

The dread of heretical contamination led Philip II. to order home all Spanish youth studying abroad, and it confined within the narrowest limits commercial intercourse with Protestant countries, so that for a time "the heretic trader took his life and fortune in his hands when he ventured to make a Spanish harbor."

With study abroad prohibited and a close watch kept on all foreigners at the frontiers, the only vehicle left for new ideas was the printing-press, and the censorship took care of that. State censorship of books had been established by Ferdinand and Isabella; but it was not until 1521 that the Inquisition asserted its authority in this field for the purpose of preventing the introduction and spread of Lutheran writings. How this control was exercised, through the Index, the expurgation of bookshops and libraries, the search of ships' cargoes, and

the supervision of matters of morals and art, Mr. Lea sets forth in one of his most notable chapters and illustrates with typical documents in the appendix. There could be but one result, which is thus described in the closing paragraph of the third volume:

Thus the censorship of the Inquisition was all-embracing, from the most dangerous heresies of Luther and Calvin, the popularization of Scripture, the relations between Church and State, and the liberalism of the modern era, down to the veriest trifles. It was an engine of immense power, constantly applied for the furtherance of Obscurantism, the repression of thought, the exclusion of foreign ideas, and the obstruction of progress. It was accompanied by a State censorship, based upon the law of 1558, perfected in innumerable successive regulations, of a character most vexatious and embarrassing to authorship, and this duplication of censors exercised a most deplorably depressing influence on literature and culture. Authorship was discouraged by the uncertainty whether works, on which perhaps years of labor had been spent, would secure a license to print; the business of publication was rendered extra-hazardous by the fact that a book, printed with due license from the State, might at any moment be prohibited by the Inquisition and the whole edition be seized and destroyed, while purchasers who had bought such a licensed book were liable to be deprived of it without compensation. Thus, between the State and the Inquisition, whether working in unison or at cross-purposes, the intellectual development which, in the sixteenth century, promised to render Spanish literature and learning the most illustrious in Europe, was stunted and starved into atrophy, the arts and sciences were neglected, commercial and industrial progress was rendered impossible, and the character which Spain acquired among the nations was tersely expressed in the current saying that Africa began at the Pyrenees.

CURRENT FICTION.

Martin Hewitt, Investigator. By Arthur Morrison. New York: Harper & Bros.

The Thinking Machine. By Jacques Futrelle. New York: Dodd, Mead & Co.

The Case of Doctor Horace. By John H. Prentis. New York: Baker & Taylor Co.

The short detective story has become so thoroughly conventionalized within the last few years that it would be as unfair to accuse an author of imitating Sir Conan Doyle by describing the exploits of an unofficial detective of marked personal peculiarities, rapid and incisive deductive powers, as to accuse him of imitating Pinero by writing a play in three acts.

Mr. Futrelle has been bold enough to christen his elucidator in so many words the "Thinking Machine," mentioning only now and then his real name, Prof. Augustus S. F. X. Van Dusen, the scientific man who is consulted on occasions of great stress by Hutchinson Hatch, reporter, a journalistic counterpart of Dr. Watson. "Nothing is impossible," is Professor Van Dusen's dictum. "The mind is master of all things." Martin Hewitt, Mr. Morrison's detective, on the other hand, always maintains, more modestly, that he has "no system beyond a judicious use of ordinary faculties."

The criminals with whom Prof. Van Dusen has to deal in the seven tales here printed are, perhaps, as modern a lot as fiction affords. They turn scientific knowledge to their own purposes in ways that are dark indeed; in fact, rather beyond the scope even of legitimate science. Mr. Morrison's criminals, equally ingenious, employ more familiar agencies for their nefarious business. Mr. Futrelle, it might be said in generalization, is the more fertile devising enigmas, Mr. Morrison in answering them without straining.

On this point, the detective story must be judged by canons of its own. It is the first duty of the writer to carry out his implied contract to provide for every problem a solution that shall be complete and adequate, with the minimum of evidence left in the detective's sole possession till the last moment. From this point of view, it is hard to justify the use of an actually false clue under any circumstances. The reader should have the chance to match his wits on even terms against the writer, who must give as much information as possible, without disclosing the final solution. Now Mr. Futrelle is guilty of keeping up suspense by false evidence. The whole mystery in one of these stories is sustained through twenty-six pages, on the supposition that a revolver shot fired in a certain direction struck nothing. It is only explained at the very end of the story that the constable merely missed his mark. The mistake might easily happen in an actual criminal case, but it does not properly belong in a detective story. For a narrative that complies with the same condition, giving substantially all the necessary clues before the final revelation comes, the first of the Martin Hewitt stories, "The Lenten Croft Robberies" may be cited.

With the requirements of the detective story in mind, one may well wonder why John H. Prentis did not choose this form for "The Case of Doctor Horace." Indeed it would not be bad advice to begin the book on page 65, at which point the detective starts his investigation of the crime or supposed crime, which has already been explained to the reader. The opening chapters could be read almost as well after the closing. "A Study of the Importance of Conscience in the Detection of Crime" is the formidable sub-title of this story. The "study" is made by means of a simulated murder. A wager has been made between two friends, one of whom holds the Websterian theory that it is always a guilty conscience which betrays a criminal to the law, while the other regards the comparative certainty of arrest as merely a matter of superior force on the side of justice. To settle the point the two men arrange a mock murder of one by the other. The body of a pauper strikingly resembling Dr. Horace is found, all the circumstances of the crime arranged, and at a certain daybreak Edwin Wallace, exponent of the "conscience" theory, is turned out in the streets of Detroit, a fugitive from justice, a murderer in all particulars except that no guilt of blood is on his soul.

It is an idea of manifest possibilities, and Mr. Prentis's book begins promisingly. His idea of letting the detective construct from the clues at hand an unfeeling monster as the criminal to explain the acts of an ordinary man with a clear conscience is good enough to redeem the apparent anti-climax of starting the search after the end of it is disclosed. The story, however, though readable throughout, weakens deplorably in the latter chapters. The absence of illustrative quotations from the heads of chapters after the tenth marks also a sad decline in invention. The device by which the fugitive is allowed to escape arrest because the detective is momentarily too angry to see him is puerile.

The Cave Man. By John Corbin. New York: D. Appleton & Co.

It is evident that, to a large fraction of the public, a novel has come to mean a highly technical description of some form of sport or business, into which has been woven a mechanical love affair or two. The longer the special terminology, the welcomer the novel, since such productions make no greater demand upon the reader's imagination than an average newspaper report. Consequently, "The Cave Man" may be confidently recommended to college lads (for is not the opening scene laid in the Stadium itself?) and to all whole-souled motorists. The latter will find it a pleasant variant upon the usual "Bubble" story, since it strikes deep at the root of matters, and deals not only with cranks, cogs, and gears, but also with a full-fledged and sinful motor Trust. To readers of another kidney, it will seem pathetically artless in its crudity, in the knowingness which patters an endless vocabulary of mechanics and current slang. The polo games, the "iced bottles," the local jests, all fail to infuse one breath of life into the plots and counter plots of the Trust maker and the Trust buster.

Studies in Seven Arts. By Arthur Symons. New York: E. P. Dutton & Co. $2.50 net.

Whoever means to become a "centrist" critic in mature years does well to be creative in youth in one of the eccentric schools. Thus one avoids the easy jibe—that one was born an academic, color-blind, stone-deaf, and the like. Arthur Symons has taken this precaution. He is one of the few decadent poets of quality that England has produced; for years he has been a sort of official envoy of the Parisian symbolists at London. It is something of a surprise then to find him a critic almost of the old-fashioned magisterial sort. We are accustomed to him as a subtile analyzer of his personal impressions, neither seeking nor expecting any better apology for them than that they have been deeply felt. Here we find him going behind the impression for universal principles. The result is a rather curious and not wholly pleasing mixture of the old sensitive somewhat profuse diction with a ratiocinative mood. Pater is avowedly the patron saint of the volume, but it is far more metaphysical than anything the recluse of Brasenose ever permitted himself.

To be a disillusioned decadent is not merely to have seen, but also to have seen through much, and Mr. Symons is perhaps most exhilarating in the ruthless analysis of such kindred spirits as Gustave Moreau and Richard Strauss. The essays in which he sets forth the frigid doctrinarism that underlies the pyrotechnics of these two men of supreme talent are among the best in the book, escaping measurably the *morbidezza* that elsewhere attenuates much excellent reasoning. But the reader does not yet know why the arts are seven. Sculpture,

painting, architecture, music, are familiar enough: to these the author adds handicraft (which is hardly a separate art), the theatre (considered as a nexus of drama, pantomime, acting, scenery, and costume), and the dance taken by itself. These arts are considered in their contemporary and most significant aspects. To get at the gist of the book we may eliminate the four short studies of the theatre and the ballet at the end. They contain an interesting theory of the stage, based largely on Gordon Craig's teachings, and some suggestive passages on the decadence, but the scale of these essays is too small to be persuasive; much that is said in them is better said in the admirable essay on "The Ideas of Richard Wagner," and they were, on the whole, better out of the book. As much may be said of the essay on cathedrals, Cologne, Canterbury, Amiens, Bourges, which reveal Mr. Symons in his old musing vein and have little to do with architecture as such, being largely devoted to Gothic sculpture. An essay on the "Decay of Craftsmanship in England" is again, like so many other "decays," a good old journalistic friend offered here as small change. One would be loath to miss the essay on Eleonora Duse, personal as it is to the point of indiscretion. In it one may admire the paradox that the greatest actress of our times has prevailed through scorn of her art and a practice of repression that is the very negation of acting itself. The fact is eminently piquant and modern. Duse once told Mr. Symons petulantly that the only way to have a real theatre was to let all the actors die of the plague. A less painful clean-sweep, and an equally effective one, would be for the entire profession to imitate her own dramatic reserve. We could dispense with the essay on "The Painting of the Nineteenth Century," a review of D. S. MacColl's excellent book, not but that it is a workmanlike review, but it is, perforce, scrappy, and its few general ideas are found also in the studies of Watts, Whistler, and Rodin.

We feel justified in paring this collection down to its substantial contents, the essays on Rodin; the three on painting, Watts, Whistler, Gustave Moreau; the three on music, Beethoven, Wagner, and Richard Strauss; because Mr. Symons in his preface and elsewhere has made solemn profession of discrimination. That indispensable quality is never more in place than when one is tempted to promote one's journalism to the dignity of fair type and sober cloth. The seven essays just enumerated above belong to the best of our time. They are indeed discriminating. No one has more truly described the wholly voluntary smallness of Whistler's greatness, no one has grasped more firmly the unerringly pictorial quality of every design of Watts. That criticism is defective only on the technical side. Watts with his undoubted genius carried a terrible handicap of lapses in workmanship. Take the portrait he did for the Uffizi, you are tempted to say it is the most splendid thing in its gallery, until you note its ghostliness, its absence of bone and muscle, of all that means palpable reality.

The longest and the most valuable essays are those on Beethoven and Wagner. In particular everybody should be grateful for the clear summing up of Wagner's æsthetic ideas. It would be difficult to find elsewhere so good a statement of what Wagner meant for art in general—a statement drawn from many difficult treatises and happily divested of biographical and merely controversial digressions. We may note in conclusion an interesting harmony between the three essays on painting and those on music. They constitute a parallel series: a great instinctive and elemental artist, Watts-Beethoven; a great artist of the conscious and reforming type, Whistler-Wagner; and a great talent of the uninstinctive and cerebral sort, Gustave Moreau-Richard Strauss. All these studies, with the Rodin, are stimulating, freighted with much reading and knowledge of life. They bring us nearer a definition of some of the typical geniuses of the century just passed. They reveal certain pitfalls that yawn for the artist when his art shuns society and grows in the ill-ventilated chambers of the individual mind.

Homer and His Age. By Andrew Lang. New York: Longmans, Green & Company. $3.50 net.

Pour Mieux Connaître Homère. By Michel Bréal. Paris: Hachette & Cie.

Two entertaining chapters are added to the History of Variations—of Homeric critics by Andrew Lang's "Homer and His Age," and Professor Michel Bréal's "Pour Mieux Connaître Homère." The Englishman and the Frenchman maintain an *entente cordiale* in their common rejection of the theories of their German predecessors, and the condemnation of their methods. The "Iliad" is not a *Volks Epos*, or an unconscious organic growth, whatever that may mean, but a product of conscious art. There is, and can be, no popular epic. Such unity and structure as the "Kalewala" possesses is the creation of Lönnrot. The Homeric poems were not transmitted by oral tradition, but were composed or preserved with the aid of writing—the alphabet being now proved for Crete and the whole Mediterranean basin centuries before the earliest date that can be assigned to Homer. The "Iliad" is not a haphazard collection of ballads, but an artistic whole, and the unity of its literary manner, the consistency of its leading characters, and its harmonious picture of a single stage of culture are irreconcilable with the hypothesis that it is a "mosaic of the work of several changeful centuries." It was never translated out of Æolic into Ionian, and its different strata, supposing them to exist, and occasional interpolations, cannot be detected by linguistic analysis of its originally composite dialect.

With these negations, however, all agreement ends. Mr. Lang proves to his own satisfaction that the Homeric poems consistently represent the culture of a single age, the age which follows the late Mycenæan shaft graves and precedes the tombs found outside the Dipylon gate at Athens (900-750 B. C.). The Mycenæans buried; the people of the Dipylon age sometimes buried, and sometimes burned; but they did not build cairns. Cremation and burial in barrows, with no ghost worship, is the mark of the Homeric age. "We can go no further till we find an unrifled cairn burial answering to Homer's description"—the absence of which both surprises and grieves Mr. Lang. M. Bréal, on the other hand, is confident that the Homeric poems were composed not earlier than 700 B. C., by a guild of Greek poets residing at the court of the later kings of Lydia. He greatly lightens the burden of maintaining this thesis by not raising the question of their relation to Hesiod, or to the Cyclic poets whose introduction of customs unknown to Homer is one of Mr. Lang's chief arguments against a late and gradual evolution of the "Iliad" and "Odyssey."

Again, Mr. Lang cites "Beowulf," the "Niebelungen Lied," and the Chansons de Geste to show that early poets do not archaize or attempt local or historical color. And he infers that the weapons and methods of fighting of the Homeric warrior reflect contemporary practice, which need not, however, have exhibited the uniformity postulated for any given generation by the vigorous and rigorous analyses of Reichel and Robert. To M. Bréal, on the contrary, nothing seems plainer than that "l'idée de noter les choses du jour est une idée qui vient tard en littérature." Homer, he thinks, describes in such detail the accoutrement of his heroes because it was strange and romantic. He represented them as fighting from the war chariots with which Egyptian and Assyrian art had familiarized his imagination in order to lift them above the prosaic level of modern life.

Mr. Lang, after an elaborate comparison of Agamemnon with the Charlemagne of mediæval epic, concludes that nothing but experience or a course in the history of feudalism could have enabled Homer to portray so truthfully the peculiar relation of a feudal suzerain to his subordinate and insubordinate vassals. But M. Bréal thinks that the Homeric Zeus alone is sufficient proof that Homer's conception of royal authority was derived from observation of an Oriental monarchy. Mr. Lang rejects both the school of Chios and the Commission of Peisistratus, and affirms that there is no example in history of a great artistic unity resulting from the labors of a school or a committee. M. Bréal finds the true analogue of the "Iliad" and "Odyssey" in the mediæval cathedrals, and argues that though the poems could not have sprung directly from the people or been sung by strolling rhapsodes, they might have been, and probably were, produced by a school of bards composing on prescribed themes in a traditional style for Greco-Lydian festivals, antetypes of the later Panathenaic and Olympian competitions. Popular tradition attributed the work of these bards to "Homer," who may or may not have been the first or greatest of them. The stress laid on the idea of glory and posthumous fame in the "Iliad" may be due in part to the agonistic element in these competitions. And the frequent references to the "sweet fatherland" express the homesickness of Greek exiles at a semi-barbarian court.

It is not worth while to pursue the antithesis further. Until we discover some method for converting possibilities or plausibilities into probabilities and certainties, the value of such books as these will reside not in their conclusions, but in the stimulating effect of their incidental

discussions of Homeric poetry and primitive Greek civilization.

Though both works are readable, neither is properly speaking a true book, laboriously and carefully composed in a spirit of respect for the subject and the reader. Mr. Lang has looked into a great many authorities and collected a vast amount of material about burial and cremation, bronze and iron, primitive weapons, the comparative literature of the epic and other interesting topics. The vivacity of his polemic, his wealth of allusion and occasional felicities of phrase engage and hold the attention. But he has evidently written up his notes *currente calamo*, with little concern for system and unity of presentation, consistency in argument, or the elimination of wearisome repetition.

M. Bréal's slighter performance being French, is, of course, not quite so formless. But if we were to hazard an Homeric hypothesis about the composition of his book, we should conjecture that it has been put together out of old class-room lectures and lecture notes. The lectures, filling pages 1-131, set forth the hypothesis which we have outlined. The notes, of which we have not spoken, occupy the rest of the volume, and under the somewhat pretentious title of "Lexilogus," for which the author apologizes, present a choice of sporadic observations on the etymology or meaning of about 150 Homeric terms. Ἤριον is derived from ἠρώιον, Boeotian ἠροῖον. Its occurrence in Iliad, xxiii., would then be a confirmation of the later origin of that book.

A Genetic History of the New England Theology. By Frank Hugh Foster. The University of Chicago Press. $2 net.

From 1734, when Jonathan Edwards preached his celebrated sermons on Justification by Faith, to the withdrawal of Edwards A. Park from his theological chair at Andover one hundred and fifty years later, a noble army of theologians in the divinity schools and pulpits of New England contended valiantly for the faith once delivered to John Calvin. The contrast between the New England divines and less progressive and original representatives of the Calvinistic system, may have blurred, to the perception of some, the essential loyalty of the New England fathers to their Genevan master, but that they were loyal to the fundamental principles of the "Institutes" cannot be doubted, even in the case of the latest representatives of the school. In New England, Calvinism had a chance to show what it could do, not only with a single generation whom it enfranchised, but also for the education and development of successive generations. During the century and a half of its sway in Puritan America, it was called upon to face the most serious and vital questions that can be raised under the Christian system of truth. Not only Edwards, but other leaders of the school as well, were men of unusual powers of mind, possessing also something of the prophetic gift. The historian of the New England theology, therefore, has a subject of great importance and fascinating interest, which leads into the deeper problems of religion and calls for clear judgment on the most difficult questions with which faith and philosophy have concerned themselves.

Prof. Foster has appreciated his subject, and bestowed upon it the labor and pains which its importance deserves. His criticism of the work and writings of the successive theologians is clear and penetrating. He is at pains to bring to light the order and progress of New England thought, and to exhibit the "improvements" which others besides Edwards effected. At the same time he acknowledges with entire frankness the insufficiency of the reply to Channing and the Unitarian movement; he demonstrates fully the deadening effect of the Calvinistic system when continued for generations as the sole religious doctrine of a community, records the collapse of Calvinism as a vital religious doctrine in New England, and traces its downfall to weaknesses in the system itself.

It is evidently a matter of keen pain to the author that he is compelled to narrate the fall as well as the rise of a distinct school of theology in New England. Such feeling is natural to one of Puritan antecedents, and yet the real wonder is that there should have been a New England school at all, and not that it should have disappeared. New England only received the theology of the Westminster Confession, and worked out its salvation by means of it, or shall we say, notwithstanding it, more thoroughly than was done elsewhere. This was due partly to the isolation of the country and the homogeneous character of its religious life, but more largely to the remarkable succession of great men who were the leaders of New England religious thought. The extinction of the school is to be laid at the door of men outside the confines of Puritan territory, who ushered in methods of thought and investigation which New England could not have been expected to discover, but whose conclusions she was too pious to resist, even at the cost of her own beliefs.

Prof. Foster may be allowed considerable enthusiasm for his saints, but it is a pity that his admiration of Bushnell and his conviction of the similarity of the views of the Hartford preacher and those of Ritschl, betrayed him into speaking of "the inferior Ritschl." Surely this is one of those comparisons which partakes of the proverbial nature of such indulgences.

Science.

Life and Evolution. By F. W. Headley. New York: E. P. Dutton & Co. $2.50 net.

Although the author has written carefully, and has made but few slips of statement, this volume is, in a number of ways, unsatisfactory, and not least so in regard to the mechanical make-up. It is printed on uncoated paper, yet is awkward to hold, while it opens with such difficulty that reading it is made anything but a pleasure. Why numerous full-page insets should be given up to small line cuts is not clear. Both the value and appearance of many of the numerous illustrations are injured by their amateurish, not to say slovenly, character. To refer to one example among many, in the upper illustration facing page 105 we have part of a fireplace, four shelves of books, a wooden chair, and a ravelled piece of cloth, against which is leaned a bony structure, surrounded by rough, uneven letters and figures. The caption tells us that this mosaic represents the "Skeleton of Wing of Adjutant Bird"! In these days of splendid book-making and skilful and cheap retouching, there is no excuse for a book of this kind being bound and illustrated as this one is. On the other hand, there are a number of photographs which, by their very excellence, emphasize the mediocrity of the remainder.

As to the subject matter itself, it is disappointing to those who have read Mr. Headley's two former volumes, to find that in large part this covers the same ground. The average modern reader has little time for such rehashes, especially when the matter was well presented the first time. As new material we note the first two chapters on "Plants and Animals" and "The Sea." Considering the wide field here covered, it is very well done, being pleasantly written in a popular style, well adapted, as the author intends, for children.

Mr. Headley's specialty, the flight of birds, has so monopolized his pen and thoughts, that to it is devoted more than a sixth of the entire volume—necessitating a complete neglect of scores of other interesting problems of "Life and Evolution" and (considering such a title), resulting in a lack of balance which would be fatal if applied to any of his theories of flight. Indeed, the whole class of mammals is scarcely mentioned.

The portion on flight is by far the best of the book, though requiring no criticism as it is practically a review of the ground gone over in one of his former volumes. It is written in a wholly different style from the other chapters, and in fact seems out of place in this collection of life-histories and descriptive biology. If elaborated and published as a small individual volume, its worth would be far more appreciated.

The final chapters on mentality, struggle for existence, and natural selection contain nothing new, being reviews of well-known facts and theories. Occasional ambiguous sentences are most confusing, as on page 106, "The loss of teeth, found only in some extinct species, still further reduced the weight of the skull."

The Maryland State Geological Survey was established in 1896, after a long period of years without scientific work of this kind under local auspices. It was wisely associated with Johns Hopkins University, whose professor of geology, William Bullock Clark, is at the same time State geologist. Dr. Clark has proved an efficient and successful director, and has placed the university stamp of thoroughness and accuracy upon the reports which have thus far appeared. The publications have taken the form of general reports, now in the sixth volume, and of special monographs. The fifth volume contains four important papers. L. H. Bauer contributes a second article upon the magnetic work in the State.

January 1, 1900 is selcoted as a suitable date upon which to establish all the important features of magnetic declination for Maryland. Since property lines are so often based upon surveys with the ordinary compass; and since the magnetic pole varies from time to time in position, it is of practical as well as of scientific importance to record at stated periods and as accurately as may be, the facts of the behavior of the needle. Dr. Bauer has also carefully located the boundary line between the important coal-producing counties, Allegany and Garrett. The Survey has given much attention to improvement of highways. In the third part of the volume, A. N. Johnson describes the methods pursued and the results obtained. The fourth part, in many respects the most important report yet issued by the Survey, relates to the coals of the western portion of the State, and presents an accurate and well-illustrated description of these the most important of Maryland's material resources. George C. Martin is the principal contributor. The sixth volume of the Reports has recently appeared. It contains a valuable summary of the physical features of the State; geography, geology, and mineral resources are successively passed in review. The Survey has also issued a volume upon Cecil County, which forms the northeastern corner, bordering on Pennsylvania and Delaware. The area embraces the ancient crystalline rocks and the later deposits of the coastal plain. The physiography, geology, resources, soils, climate, hydrography, magnetism, and forests receive thorough treatment, and are illustrated by a separate volume of maps. A monograph has also been prepared upon the Pliocene and Pleistocene Deposits by Geo. B. Shattuck. These components of the coastal plain are soft sandstones, marls, and shell-beds, now appearing in a series of well-marked terraces and overlapping beds. Their classification and interpretation turn upon the successive relations of the sea and land as determined by elevations and subsidences. Dr. Shattuck makes a strong case by the use of these marine factors in deciphering the past history.

"North Polar Problems" was the subject of a lecture on April 29, by Dr. F. Nansen, now Norwegian Minister to Great Britain, before the Royal Geographical Society. He dealt first with the geomorphological features of the region, and said that it was of essential importance to determine the edge of the Continental shelf off the known coast. This is now known exactly in only two places. From the direction of the sea currents and the drift of the ice he was led to believe that there was land to the north of Spitzbergen, and that consequently the North Polar basin was a comparatively long and narrow depression. A drift with a ship across the unknown North from Western Alaska would give most important results, especially if observations were taken of the temperature and salinity of the deep-water strata of the deep sea beyond the edge of the Continental shelf. It would require probably five years.

In reviewing W. C. Morgan's "Qualitative Analysis," the spelling "oxid" and "sulfid" was said to be recommended by the American Chemical Society. This was an error for the Chemical Section of the American Association for the Advancement of Science.

Drama.

The Goddess of Reason. By Mary Johnston. Boston: Houghton, Mifflin & Co. $2.

The most obvious comment upon this blank-verse drama in five acts, or rather six, for the fifth act is in two parts—is that it could not be acted on the stage without severe condensation and many structural modifications. Dramatic inexperience is revealed in the multiplicity of personages; the accumulation of climaxes; the constant arrest of action, under the most improbable conditions, by long flights of declamation; the convenient apparition of characters needed for a designed situation, and the frequent disregard of nature and probability for the sake of emotional effect. But if it has serious faults, it undoubtedly possesses some conspicuous merits. Several of its scenes are admirable bits of romantic melodrama, while two or three approach very closely, if they do not actually touch, the level of tragedy. If much of the verse is simply fluent prose cut into lengths, if there are many crude and not a few broken, halt, or utterly commonplace lines, there are occasional passages of uncommon descriptive power, full of pretty imagery and verbal eloquence, and some that thrill with ardor, scorn, or vigorous passion.

The piece is a series of panoramic episodes rather than a play. The first scene is laid in a Brittany château in the summer of 1791. Many aristocrats have assembled to congratulate the new Baron de Morbec, whose starving peasants had attacked his house the previous night and been routed by a squadron of his own cavalry, to whom the alarm had been given by a lovely marquise, the chief guest. Among the prisoners is a beautiful peasant girl, Yvette, the illegitimate daughter of the dead baron—and the chief instigator of the rioters. In her De Morbec recognizes the original of a fair vision, of whom he had caught a glimpse in a woodland ride a year before, and remembered with longing ever since. For both it was a case of love at first sight, and the jealousy of Yvette towards the marquise is the one really dramatic motive of the play, although use is made of it only once.

A year later the scene shifts to a convent garden in Nantes, where Yvette, placed there by De Morbec, is jealously awaiting his return. Without the peaceful enclosure are heard the sounds of revolution. Presently De Morbec comes with the news of widespread revolt and slaughter. Yvette implores him to adopt the tricolor, and is infuriated when she discovers that he is the pledged escort of the marquise. At his departure she steals away to join the singers of the "Marseillaise." In the third act, in 1794, the revolution is at its height, and Yvette has been chosen Goddess of Reason. De Morbec and the marquise are again in Nantes, and after various escapes fall into the hands of the mob. Yvette, by an appeal which is both eloquent and passionate, secures the freedom of Morbec, but when the latter begs her to save the marquise also, yields to jealous frenzy, and denounces both to the mob.

In the fourth act all the characters are awaiting trial in a church converted into a prison. Here again there is an imaginative and striking picture of doomed aristocrats maintaining traditional gayety in the jaws of death. The fifth act shows the trial and condemnation of the aristocrats, and is full of vigorous and picturesque declamation. Yvette by a passionate self denunciation, earns death with the rest. The final episode, somewhat overprolonged and rhapsodical, reveals the condemned, including Yvette and her baron, awaiting execution by drowning on the banks of the Loire.

This rapid synopsis will give, perhaps, a clearer notion of its scope than any possible quotation of isolated passages. Of the minor details it can only be said that in the main they are vivid, ingenious, fanciful, and appropriate. Space will only permit the reproduction of one of half-a-dozen passages marked for quotation. It is a fair average specimen of the verse, and is taken from Yvette's appeal for her lover's life:

There is a little village that I know,
A hungry village by a hungry sea,
As worn and gray as any Calvary!
The hungry shadows ate the sunshine up:
The children cried, the women wailed at morn;
The very Christ looked hungry on the Cross;
When lo! a miracle! for suddenly
The starving, haggard folk began to laugh,
The tender green put forth, the flowers bloomed,
Blue shone the sky, the lark sang overhead,
And mild the face of Christ and heavenly kind!
The little village had its fill of bread,
Yea, wine it drank, and cheerful breath it drew,
And, by the well, of this strange plenty talked,
Of tolls withdrawn, of perfect friendliness!
And then it blessed the man who gave it bread,
Who had a heart to feel with wretchedness,
And a strong arm to drive the hunger forth
As Arthur drove the giants from the land!
O men of Nantes! you'll keep your oath to me!
In Nantes to-day 't is mine to loose or bind!—
I loose this man—

The performance of Ibsen's "Little Eyolf" for the first time in this city, by the Danish actress, Madame Oda, and a special company, in the Carnegie Lyceum, on Monday evening, had a certain interest because it was given with some assumption of authority. Madame Oda, evidently an accomplished performer, is said to have received instructions about the play from Ibsen himself. However this may be, the general representation was one of marked and sympathetic intelligence. But the more conscientiously the piece is played, the less fit is it for ordinary theatrical purposes. In its demonstration of the tragedy involved in sensual indulgence, the futility of dreams, and the joys of practical altruistic effort, it preaches a sound, if somewhat ancient, moral. But in its illustrative detail it descends to a crude realism which is as unpleasant as it is unnecessary. Apart from this defect it is too persistently gloomy to possess attraction for the general public.

Speaking of Émil Fabre's drama, "Timon d'Athènes," which deals with the period of the latter part of the Peloponnesian war, and has been produced at the Théâtre Antoine in Paris, an English writer says:

The author is a scholar as well as a poet, and never in modern times has antique life been put on the stage in a more faithful and genial way than in "Timon d'Athènes." Athens revives before our eyes, and we feel as if we were breathing the same atmosphere in which Aspasia and Pericles, Socrates and Plato, Alcibiades and Cleon

moved, and as if we had before us the very people for whom Sophocles, Euripides, and Aristophanes wrote their plays.

M. Lavedan is engaged upon a new play, of which the scene is laid in England, Sir Joshua Reynolds being the centre figure.

Music.

Die Musik Skandinaviens.. Von Walter Niemann, Leipzig: Breitkopf & Härtel. $1.35.

In a letter addressed to the New York *Times* thirteen years ago, Edvard Grieg wrote: "I am not an exponent of 'Scandinavian' music, but only of Norwegian. The national characteristics of the three people —the Norwegians, the Swedes and the Danes —are wholly different, and their music differs just as much." Heretofore there has been no book describing and illustrating these differences, but at last this long felt want has been supplied by Walter Niemann, who attempts, in 155 compact pages, to pass in review the principal composers of those countries and to enumerate the chief characteristics of the folk music on which the works of most of them are based. He gives his pages additional interest by brief allusions to the Scandinavian authors and painters whose works have the same national characteristics. In a final chapter he reviews Finnish music, which shares many of the Scandinavian traits; Finland has produced at least one master of high rank, Jean Sibelius, whose works are coming yearly more into vogue.

Of the three Scandinavian countries, Denmark is the least exotic, musically speaking. Its folk-songs do not differ greatly from the German in melodic intervals and rhythms. The serious predominates, and there is less variety of mood than in Norwegian music, particularly in Grieg's; nor is the variety of folk-dances nearly as large as in Norway. In Danish music "all is round and soft and nebulous." The composers, too, do not seem so "outlandish" as the other Scandinavians seem to Germans, Frenchmen, or Italians (who, together, established the normal European standard). The most prominent of them are J. P. F. Hartmann and Lange-Müller, true nationalists, whose works, however, became little known outside their own country; and, above all, Niels Gade, who for a time enjoyed a world-wide vogue. Unfortunately the influence of German masters, particularly Mendelssohn, obscured his nationalism.

Norway's greatest master, Grieg, also was in danger at one time of being engulfed in the German maelstrom, but luckily Ole Bull and Nordraak encouraged him in his patriotic inclinations, and thus he became the head of the whole Scandinavian school. To him Niemann devotes several eloquent pages, in which, however, he does not sufficiently emphasize the fact that only a very small proportion of Grieg's works are based on borrowed folk-tunes. Of the other three prominent composers whom Norway has given to the world, one, Svendsen, has little national color, whereas Lange-Müller, and Sinding are unmistakably Norse. It is in Norway that musical exoticism most runs riot. The variety of folk-dances is astonishing, and not only in their rhythms, but in their melodic intervals is there much that differs delightfully from all other music. The forms of the folk-songs are largely shaped by their texts, while the melodic peculiarities are due partly to the survival of mediæval modes (differing from the modern major and minor), and partly to the limitations of the peasant fele and other instruments. On this last point our author touches all too briefly. A most interesting monograph could be written on it with reference to other countries as well as Scandinavia.

The latest contribution to Wagner literature is the "Erinnerungen" of Angelo Neumann, just issued by L. Staackmann in Leipzig. Neumann is the manager who obtained Wagner's permission to break the Bayreuth monopoly of the Nibelung operas and give them in the cities of Germany and other countries; his conductor, fortunately, was Anton Seidl. Neumann began his career as a baritone, but he soon found that his true sphere was at the head of an opera company. He happened to be in Vienna when Wagner rehearsed "Tannhäuser" and "Lohengrin," in 1875. He gives details of the way in which the great composer exemplified for his singers details of pose, action, and facial expression, in all of which he was incomparable. After the first act of "Lohengrin" all the singers and players surrounded him to express their amazement at his achievement.

Art.

THE SALON.

PARIS, May 1.

The opening of the Old Salon—the exhibition of the official Société des Artistes Français, the only one which distributes medals and distinctions and puts an official seal on the work of young talent—has still its twofold interest, fashion and art. Both are dwindling somehow, and, taken by and large, the Old Salon is not worth the New this year, exclusive and mannered as the latter is. Of course, the Old Salon has to encourage the young. There is also new and interesting work, especially from the Spanish artists, who have a note of their own, and from a few Americans whose art is high in applying paints skilfully to canvas, but is often lacking in the "intellectual part," as Delacroix said of the painters of his time. For there is something which makes a great painting different from a picture well painted. Meanwhile, none of the older artists, French or foreign, none of those who have settled reputations, exhibits anything of especial note.

Bonnat has painted all the Presidents of the French Republic; his portrait of President Falliéres is strong and unsympathetic. On the contrary, Madame la Marquise de Wentworth has a portrait of President Roosevelt, which has indeed none of the qualities of the disagreeable picture of him by Chartran, but bestows on him that look of good-natured timidity which is the proper attitude of the American man before the American woman. Prime Minister Clemenceau has consecrated Mrs. Wentworth "one of the glories of American art," if she is really the Catholic lady who managed his conversation with M. Piou, as unhappily reported in the Montagnini papers. The same lady has a portrait of Queen Alexandra, an unsympathetic presentment of that most gracious sovereign. Seymour Thomas, one of our older men in Paris, has a dull but good portrait of Miss Mildred Lee, arrière-petite-fille (?) de Washington.

The most lovable picture of the entire exhibition is a double portrait by Ernest Laurent, who is not precisely a newcomer, since his first official honors date back nearly a quarter of a century. He has always had plenty of official recognition, but with the great art public he has been slow to make his way. His picture represents a man and woman seated beside each other in their own room—just an every-day husband and wife alone at home. And they are charming: first, because of the "intellect" which the painter has put into his work, bringing out into view a youngish Philemon and Baucis, the salt of the earth, without whom the world would not long stay sweet; second, because the painter's colors, like his inner thought, are at once a harmony and a glory. The paint seems applied to the canvas in colored dust, with the vibrating effect, not unlike that of Henri Martin, loved by the few, and detested of many. But here it is altogether amiable. There are light grays and bright pinks, and, dying away in the background, water-green and dull rose and mauve. M. Laurent is a Parisian by birth, but he travelled much in search of his art (a Bourse de Voyage man); and he is totally unlike his masters—Lehmann, Hébert (for he was also a Prix de Rome), and Luc Olivier Merson.

By a veritable fatality, in the same hall with M. Laurent an Austrian painter exhibits new work, which is noteworthy for harmony, both in the idea which the colors show forth and in the colors themselves. It is a landscape of Rudolf Quittner, By the River—a small river such as they have in Europe. We stand in a tree's shade and look across the placid stream—"majestic water-course," says the Parisian who knows only the Seine, and has never looked on the broad expanse of real rivers like the Hudson or Mississippi. On the other bank, the houses of a village rise up in irregular lines, with lilacs blooming over the garden walls. The sun is setting, his last rays gild brightly the housetops, and start up infinitely harmonious reflections in the water below.

It is a comfort to see new Spaniards exhibiting in such numbers. Their eyes are attuned to lights which are at times fierce, but never standardized, as with most moderns. Something might be said in praise of all their work, but it is enough to choose the two most striking. Lopez Mezquita has a portrait group of My Friends—young artists, an old hidalgo, a young priest—all with startling life under the pitiless sun of Granada. What a difference between this group and the Committee of the Association of Republican Journalists of Paris, by Laissement, a new Frenchman, whose figures are, however, very like!

Carlos Vasquez, who had honors at the Paris Salon a dozen years ago, exhibits what is perhaps the strongest picture of the Salon. Two Catalan gendarmes, such as you see only in Spain, are leading

across country two gypsy prisoners—a man and a woman. The woman, a human animal at bay, puts one in love with all the criminal classes, just as we are all of us for the prevention of cruelty to animals. But the gendarmes are worthy and kind, almost paternal, with their faces shaved like any foothaller's, and their comic-opera uniform. It is too pathetic to he laughable; too real to seem theatrical; and it should set many reading Lomhroso and George Borrow. Especially as in Lopez Mezquita's painting the human heings are alive and not merely painted. And no one can complain that the "intellectual part" is wanting to these paintings of Spaniards.

Henri Zo, who is a French Basque and so next door to Spain, has not advanced this year; but he has succeeded in painting a thin stream of sunlight. Under the awning of a *patio* a man and two women, smartly dressed, loll through the heated afternoon in reclining chairs. In the hackground, through some opening in the awning over their heads the fierce sunlight falls in a thin ohlique column; and in the atmosphere of shade it is real sunlight that for once has been painted, and not a mere light-colored symbol. It is a different trick from that of Henri Martin, which is usually eked out with golden grain and deep tree shadows, as it is this year, where his peasant—just a charming outline of shade—stops to kiss his little child. The curve of his cheek and form against the sunlight shows the young father, swelling with the happiness of life at its full. This is quite in praise of Henri Martin, who does not advance in his art, perhaps because the application of colors which artists too often mistake for the art of painting preoccupies him too much.

On the whole, Paris is holding her own in art, so far as these exhibitions show it—but little more. S. D.

THE LONDON NEW GALLERY.

The tradition lingers that the spring exhihition at the London New Gallery is one of the important picture shows of the year. Once induce the British public to helieve a thing, and the difficulty is to make them stop helieving it. There was some reason for the reputation of the Gallery at the start, twenty years ago. It inherited the traditions of the Grosvenor. The Burne-Jones School was still strong enough to give it distinct character. But the managers, though they have inherited the traditions, are not carrying out the principles of the Grosvenor. Sir Coutts Lindsay had big ideas. Only the best work was to be shown on his walls—the best wherever it might come from. To secure it, artists were to he invited to send special specified works, and the selection was made in the studio beforehand. It is true that Sir Coutts Lindsay did not always keep up to the level of his own high amhition, hut he came near enough for the Grosvenor to deserve its reputation. Invitations are also given hy the New Gallery, hut—judging from results—not often with the ohject of ohtaining the best. The show has come to have something of the air of a family gathering for the few connected, in one way or another, with the Gallery. Some of these few, it is not unfair to say, would not easily find a chance to exhibit themselves elsewhere, even in London. There is a suggestion that titles to exhihitors' names are a recommendation. The Burne-Jones legend and influence survive only in rare canvases, neither very notable nor charming, if the simple and delicate little landscapes hy Mrs. Stillman be excepted. Academicians are prominent, and they, as a rule, reserve their more important performances for Burlington House. And the worst of it is, that the International Society, which really does aim at representing the worthy outsiders, holds its winter exhihition in the New Gallery, and so sets a standard that cannot be forgotten between the last of March, when the International closes, and the last of April, when the regular New Gallery show opens.

All things considered, therefore, one should not he surprised to find how little of interest there is in the collection this year. And yet, it does come as a shock. The little is so very little. Mr. Sargent is conspicuous: in the first place, hecause his technical accomplishment always seems more astounding in London than anywhere else, for in London he has few technical rivals; in the second place, because, for the largest of his three pictures—the Rev. Edmond Warre, D.D., C.B., M.V.O., Late Head Master of Eton, Presentation Portrait—to which a centre of honor is given, he has used such a very hig canvas, as if by size alone he could express the dignity of his subject. One cannot help looking at it, but it is hardly to be counted one of his successes. The Doctor stands on steps, leading, presumably, from school or chapel, against an architectural hackground that resembles nothing so much as scene painting. Nor has Mr. Sargent trouhled to keep the figure in the picture; it has no relation to its surroundings, it has stepped out of their atmosphere, and is not fine enough, nor strong enough in character, to excuse such a pictorial liherty. Not even the Doctor's gown, though it has picturesque possihilities, seems to have interested him. That he can, if he chooses, paint architecture delightfully—or suggest it—is seen in a small Architectural Study. His other sitter, Mrs. Harold Harmsworth, apparently has not interested him much more than Dr. Warre. Some of the detail, especially a pale blue gauze drapery floating ahout the figure, is wonderfully rendered, but both figure and face are characterless, colorless. Among the other portraits are two hy Sir George Reid—a Sir Charles B. Logan, D.D., Deputy Keeper of the Signet, 1887 to 1905, and the Very Rev. Principal Robert H. Story, D.D., LL.D., Principal Clerk of the General Assembly of the Church of Scotland, 1905—serious and learned as his portraits always are, but dull and prosaic.

Of what the critic calls "suhject pictures," there are no examples of note: there is no one taking up the hurden of Watts and Burne-Jones. Of the landscapes, the most striking are hy Mr. East who, in the Dignity of Autumn, is distinguished hy his usual feeling for composition and marred hy his usual self-consciouness in trying to express it; and by Mr. and Mrs. Withers. Neither is the sculpture remarkahle. Mr. Thomas does not even provide the sensation of rejection. And Prince Troubetzkoi was better represented in this winter's International, though his Bernard Shaw, Esq., will draw the crowd that fulfils the aim and object of Mr. Shaw's habit of self-advertisement. Altogether, whatever justification there is for the exhibition is scarcely to be found on the walls or in the central court.

N. N.

A discovery is reported from Naples, which, at the present moment, when the excavation of Herculaneum is in prospect, has special interest. The famous bronze quadriga, mentioned by Winckelmann in his writings as having heen found at Herculaneum, but of which all trace had long heen lost, has been redlscovered. A young Italian, Ettore Gabrici by name, is the ingenious finder. According to an old tradition, a large bronze horse in the National Museum at Naples was supposed to be the only remnant of this chariot. As a result of long-continued studies of the bronzes in the exhihition halls and magazines of this same museum, and of a careful examination of the documents relating to the excavations of the Herculaneum bronzes, carried on between 1739 and 1872, Gabrici has been ahle to identify a number of pieces as undoubtedly helonging to the same monument, and forming part of the quadriga. The most important of these is the statue of a male figure, which, by its attitude and the movement of its arms, is marked out as a charioteer. The other pieces are various parts of the chariot and of the pole, a fragment of the wheels, the yoke, two decorative statuettes from the chariot, many fragments of horses, in short enough to attempt the reconstruction of this colossal monument.

Among the late accessions of the Metropolitan Museum of Art the altarpiece dedicated to St. Andrew, and attributed to Luis Borrassá, is perhaps the most important. It is composed of five large panels with a base of seven smaller panels. The central panel is a figure of St. Andrew seated, holding a large cross, his face full of resignation and sorrow. It is painted in distemper, which accounts for its remarkable state of preservation, after having been exposed to the air for some four hundred years. In speaking of this altarpiece, Roger Fry calls attention to the several artists hrought to light hy Señor Sanpere y Miquel in his book, "Los Cuatrocentistas Catalanes," which reveals a flourishing school of painting in Barcelona throughout the fifteenth century.

Dr. A. Schulten, working with funds provided by the Prussian Government, has excavated the site of the old city of Numantia, which was destroyed hy Scipio, and has determined the position of the forts thrown up by Scipio's beleaguering army. Dr. Schulten's discoveries will throw light on a difficult period of Roman history.

The *Bollettino d'Arte* for April is as usual largely devoted to museum news. The gallery of the Turin library has heen rearranged with a view to emphasizing the Pledmontese school. At Parma a fine Dosso has been bought—a St. Michael disciplining the fiend in a splendid landscape. The addition is valuable hecause of the analogies between Correggio and the later painters of Ferrara. The leading article is a study of a Greco-Roman sarcophagus recently discovered near the church of S. Vittorio.

Ravenna. The sculpture represents an oculist examining a patient, and there is a garbled Greek inscription in Roman letter, which Dr. Paolo Amaducci has ingeniously emended and translated. The work is of the end of the third century, A. D., and poor enough, but the piece is rare iconographically, and recalls the Grecian origin of Roman medicine.

By the time this note is printed the exhibition of Umbrian Art at Perugia will be in full swing, and connoisseurs will be more or less amicably tearing the catalogue and each other to pieces. Out of such strife some truth usually comes. There is also an enormous influx of the nonmilitant and merely curious, not to mention the dealers. From all parts of Italy round-trip tickets are to be had at greatly reduced rates—a point for tourists to remember. Those who wish to see the show in its early, and (judging by previous experience, incomplete) stages should engage their rooms a month in advance. The wise course for most will be to wait till the rush is over, for as summer approaches the upper Tiber valley becomes only more attractive.

Edward Kemys, a veteran of the civil war, and a sculptor of wide reputation, died on Saturday at his home, in Washington, in his sixty-fifth year. Mr. Kemys was born in Savannah, Ga., but his sympathies were strongly with the North and he enlisted, when little more than a lad, in the Sixty-fifth New York Infantry. He served until the close of hostilities, and was mustered out with the rank of captain of artillery. He was a member of the group of engineers who laid out Central Park in this city, and in connection with this work he accidentally discovered his own talent for animal sculpture. Without previous training he modelled a wolf's head with such facility and vigor that he determined to study and devote himself to sculpture. He went to Paris and exhibited for the first time in 1878 in the Paris Salon a bronze group of Bison and Wolves. Later he returned to America and spent a great deal of time in the West, hunting and studying the wild animal life of the plains and the Rockies. One of his best known works, The Still Hunt, is in Central Park, and Panther and Cubs is in the Metropolitan Museum. A collection of fifty of his bronze works is in the Natural Museum at Washington.

François Eugène Burney, the French engraver, has died, in the sixty-second year of his age. M. Burney was a pupil of Ferdinand Gaillard, and his engravings after Holbein, Velasquez, and others show the style of his master.

Finance.

"DOLLAR WHEAT."

For the first time since the markets were calculating, two years ago, how to provide for the season's bread-eaters out of the short wheat crop of 1904, the price of wheat last Monday, in both New York and Chicago, passed the dollar-mark. "Dollar wheat," like "ten-cent cotton," is a traditional landmark in the trade; when prices rise above that level, it is recognized that an old-time "boom" is in progress. During the general advance of the world's commodity prices, in the past ten years, these two objective points have been reached with reasonable frequency; before the decade began, "dollar wheat" was for many years an unknown phenomenon. Cycles of high prices in wheat, and cycles of low prices, follow one another almost as automatically as cycles of prosperity and cycles of adversity in finance. From 1879 to 1890, inclusive, wheat prices constantly went above the dollar-mark.

In 1891, owing to the Russian crop failure, wheat was above a dollar for several months; but after August of that year, the Chicago price for immediate delivery did not reach such a level during six successive years. It will not have been forgotten what intense excitement, political as well as financial, was caused in the Presidential campaign of 1896, when in November "dollar wheat" was once more touched in New York. It was in some ways a demoralizing blow to the Bryan canvass, which had based its appeal for free silver coinage largely on the facts that "cash wheat" had sold at 53 cents a bushel at Chicago in the preceding August, that "dollar wheat" had not been scored since 1891, and on the inference that, as the Bryan campaigners alleged, wheat could never again sell at profitable prices under the single gold standard. Since that memorable election year, wheat has crossed the dollar-mark in 1897, in 1898 (when it touched $1.85 per bushel), in 1904, and in 1905. The period has, in short, been as distinctively one of high prices for wheat as the preceding seven-year period was one of low prices.

As to the reason for this alternation of high and low price periods, economists differ. Some maintain that it results from alternate decrease and increase in gold production; but unfortunately for this theory, the two sets of phenomena do not cover exactly similar periods. Others ascribe the harvest results to nature, holding that periods of soil exhaustion must follow in due course after large exploiting of new grain areas, due to a previous era of high prices; and certainly the precedent for lean years and fat years, in seven-year periods, is as old as the Book of Genesis. Professor Jevons ascribed alternations of wheat abundance and scarcity, like the resultant alternations of prosperity in general, to the eleven-year interval between maximum sunspot periods.

Whatever the cause, the fact is a matter of history. The present year's situation, however, is in several respects peculiar, and the violence of the recent advance in wheat—the Chicago price for May delivery was 78¾ cents per bushel on May 1, 82⅝ a week ago to-day, and 94½ last Monday, while on the last-named day the December option touched $1.03½—was not merely a whim of speculators. The situation of our own winter-sown wheat, the damage done in the Southwest by the cold weather, the drought, and the insect pests, and the low "May condition estimate" then expected from our Agricultural Department, were discussed in this column a week ago. The actual figures of that Government report, published last Friday, showed a condition of "winter wheat" 7 per cent. below that of April, and a loss in acreage, through abandoned fields, of 11¼ per cent. from the December estimate, and of 5 per cent. as compared with the area harvested last year. But the highly unfavorable weather conditions of the past six weeks were by no means confined to our Southwestern States. The same abnormally low temperature, which blighted the Texas and Oklahoma wheat, froze the ground in the Northwest, where 25 per cent. of our wheat crop was raised last year. Farmers should have planted their "spring wheat" four or five weeks ago; throughout a good part of the Red River Valley region, and in the whole of the upper Canada, they have hardly got it under ground as yet; and this means a crop prematurely exposed, in its early and tender growth, to the hot winds of summer, and equally jeopardized, because of its delayed maturity, by the frosts of early autumn.

Meanwhile, by a most unusual coincidence, precisely the same abnormal cold—of which even people in our Atlantic seaboard cities have been complaining—has overhung the European continent. France, Germany, Russia, and the fertile Danube Valley, which among them raised

Financial.

Convertible Bonds

In the third edition of our 6-page circular, entitled "Convertible Bonds," we describe practically all of such investments now upon the market. In addition, we explain why such bonds, when properly selected, are well regarded by conservative investors, and also why they possess every probability of returning exceptionally large profits.

Properly selected investments are based upon safety and income yield combined; in other words, minimum risk of principal and maximum income return.

last year one-third of the wheat of the world, have been watching their crop with apprehension. Here was at least the possibility of an exceptional situation, certainly not witnessed in a dozen years. When our wheat crop ran comparatively short in 1904, Russia increased her own to precisely the extent of the shortage. When Russia's partly failed in 1905, a large American crop made up the difference. Even in such a year as 1897, when crop failure cut down Europe's yield 352,000,000 bushels from the year before, North America produced 105,000,000 bushels more than in 1896. These reminiscences will give some idea of the peculiar possibilities to-day.

They are as yet only possibilities; the chances are still heavily against such world-wide deficiency as occurred in the famous year 1881, when scorching drought withered this country's crops, and when, simultaneously, a wet harvest half destroyed the yield in England and on the Continent. What the effect of such a shortage, supposing the worst to happen, would be on the financial situation, and in particular on the "American boom," is a question which many financiers are putting to themselves. It would certainly injure prospects on both hemispheres. The price of wheat would, of course, advance to figures not yet approached, and we should hear once more the familiar argument that a short crop sold at high prices is quite as good as a "bumper crop" with values low. But this is pure illusion; it is of a piece with the argument that the burning of San Francisco was a good thing for business, because the rebuilding of the city would increase the demand for materials and labor. A year's harvests are the new wealth on which the ensuing season's prosperity is based, and high prices for what is left after wholesale destruction cannot possibly make up for what is gone. In 1881, the results were distinctly bad; notably on our foreign trade, for with all the higher price, we had little more wheat than our home consumers needed, and a great part of our annual export disappeared.

To this day, it is a matter of discussion, which event caused the admitted "downward turn of prosperity" that began with 1881—the assassination of Garfield, the exploding of an unsound financial "boom," or the failure of the crops. The best consolation to the American farmer, in the event of serious further damage to our wheat crop, would lie in the recent spread of "diversified farming," which makes possible, after one early crop has failed, the substitution of other crops with a ready market. And meantime, it still remains to be proved that even our wheat crop is to be seriously damaged.

By SEWELL FORD

The Nation.

NEW YORK, THURSDAY, MAY 23, 1907.

The Week.

Seldom has a Governor had so marked a triumph as that of Gov. Hughes iu the unopposed passage of the Public Utilities bill on which he staked the whole success of his Administration. To have pressed a measure so comprehensive, so fair, and so expressive of the best public opinion that both parties in the Assembly were forced to accept it unanimously, was a great achievement. How great, it is easy to overlook in this hour of victory. The result now seems to have been foregone; but it was not. A formidable campaign against the bill had quietly, even secretly, been organized. There was, for instance, the press bureau set up to flood the newspapers with "arguments" against the Governor's plan. It suddenly went out of business not long ago. We have sorely missed the daily envelope, with its enclosure of great thoughts placed at our disposal. What caused the collapse of the opposition? It was not the Big Stick. That it was ever sincerely swished in behalf of Gov. Hughes may be doubted. The long, inspired, and amusing explanation in the Washington correspondence of the New York *Tribune* one day last week, of the way in which the President suddenly found "national questions" so pressing that he could no longer bother with such trifles as the New York situation, helps to set that matter straight. Even after the storv was put about that the Federal patronage had been offered Gov. Hughes to aid him in his fight—though he did not accept it—the legislative combination against all his measures remained strong and threatening. It was broken, not by manipulation or compromise, not merely by local leaders or alarmed Senators, but by the steady pressure of public sentiment making it clear that the unyielding Governor was but interpreting the wishes of the people, while showing them how to get their will enacted into law.

Our playwrights who of late have shown such a stroug predilection for politics should find in the events of the last two weeks more than one striking theatrical situation. The suddenness with which evil has gone down before good in New York, at Albany, and in San Francisco is more than dramatic; it is almost melodramatic. Here is Gov. Hughes seemingly threatened with the failure of all his policies, the bosses openly defiant, the Senators bent on his complete humiliation, when, lo, with the dawn of another day, the fragments of the Raines machine lie scattered over the plain, their forces are like Sennacherib's, and the Governor stands erect, with his foot on the neck of his enemies. Here in New York is Tammany Ahearn, under whose soporific sceptre peace breathes iu the borough departments of our city, peace on the public buildings and sewers and pavements, peace in the streets, with vast accumulations of débris and dirt. But who is this that leaps like a war god into his buggy, bent on supervising every bit of public construction in person, swinging his axe to the sound of falling heads of unfaithful servants, crying a strange un-Tammanyite *Peccavi?* It is Ahearn. Yet they say that all dramatic possibilities have been exhausted!

Mayor Schmitz and Boss Ruef were the shining marks for investigation and prosecution in San Francisco. Schmitz offered a fortnight ago to confess in return for immunity; Ruef last week pleaded guilty to what he called a false indictment against him, and declared his intention to "do all that still lies in my power to help overthrow the system which has made possible the terrible corruption of public officials." The broken boss's admission that "in order to hold together the political machine which I had built up with great difficulty, I did *lower the high political ideal* that I had hitherto upheld," is a statement laughable or nauseating, according as one may regard it. In San Francisco's orgy of corruption we have looked in vain for the display of generous Western vices, gameness, even thieves' honor. Tweed, in the hour of his flight, was less contemptible than the despoilers of the city now crawling to save their own skins. Croker and Devery appear as exemplars of sterling character. Ruef, in his extraordinary statement, made a distinction between voluntary and involuntary grafters, saying he would protect the latter while exposing all others. Such extenuation as there may be for the rottenness of San Francisco lies in the amazing rapacity of the interests which sought to make profit out of the community's misfortune. Ruef speaks as an expert when he says that "these labor-union bums" who were Schmitz's satellites "would eat the paint off a house."

If the President favors the movement for a civil pension list, it will be greatly strengthened. Certainly, of all suggested solutions of the perplexing problem of superannuation, this one is the simplest and the kindest, while the objections are mainly that it is costly and that it violates the unbroken tradition of our Government. The Keep Commission's recommendation, on which the President's project is said to be based, is not a bald civil pension system to be paid for out of taxation. The idea is for the Government to make deductions from all employees' salaries in future, sufficient to provide the necessary retirement fund. Congress would be asked only to provide for the old clerks who are now clogging the work of the departments, but who manifestly cannot at this date contribute enough for their own pensions. With this temporary aid, the plan would be on its face essentially like the Australian requirement, that every clerk, on appointment, take out a deferred annuity policy in some reputable insurance company. Apparently, the President is not much impressed by the report of a Committee of the National Civil Service Reform League, which found that the actual loss through the work of superannuated clerks is only $1,200,000 a year, and proposed a deduction of this amount from the pay-rolls. The new scheme, as outlined, sounds modest, and will be hailed with delight in every Government office. In view of the experience of this country with pensions of all kinds, however, no one can seriously suppose that this would be more than an entering wedge.

The remarkable lack of excitement in Wisconsin over the choice of a successor to Senator Spooner has been explained on the grounds that the people of the State really trusted their Legislature, and that there was no public aspirant for the seat whom they would not be willing to have sent to Washington. The choice of Isaac Stephenson in the Republican caucus, last Thursday night, is a natural way of ending a long contest that was never quite obstinate enough to be called a deadlock. Adherents of other candidates might be expected to gravitate to the man who only wanted to fill two years of the unexpired term, and would leave the field clear again at the end of that time. Mr. Stephenson's Senatorship, of course, is the reward for service done, rather than the opportunity for future service to the State. He is said to be the richest man in Wisconsin—certainly one of the richest. Twenty years ago he would have been named with the late Philetus Sawyer as a wealthy lumberman who had gone into politics. But instead of sticking to the rather sordid Sawyer school of statesmanship, he became an ally of La Follette, a former colleague in the House of Representatives, when the new movement most needed sup-

port. No one pretends that he has the intellectual parts of his predecessor, but his State has accepted him as a sincere convert from the practices for which his class was once notorious.

Having exposed the falsehoods of diplomats, Senators, railway magnates, and newspaper reporters, President Roosevelt has now turned to yarns about wild animals. There, for example, is Jack London, who represents a bulldog as putting up a good fight with a wolf. "This thing," says the President, "is the very sublimity of absurdity"—"a closet product." London makes the equally inexcusable mistake of permitting a wolf to be beaten in a fight with a lynx. But William J. Long seems to be the worst offender. He describes the killing of a caribou by a wolf which had bitten the caribou behind the shoulder. Now we have it on the President's authority that "nothing except a shark or an alligator will attempt to kill by a bite behind the shoulder." Animals take different bites, just as some people prefer a chop to a leg of mutton. The difficulty with Mr. Long is that he lacks hunting and sporting experience. Let him go to a dog fight and learn wisdom, for "no man who knows anything of the habits of wolves or even of fighting dogs" would make such mistakes. E. Thompson Seton escapes severe censure, but is warned not to mix fiction with fact. "Nobody is deceived," says the President, "by Mr. Charles G. D. Roberts," who "loves the wilderness," but who writes "fairy tales." He points out also the danger of these misrepresentations. "If the child mind," he says, "is fed with stories that are false to nature, the children will go to the haunts of the animal only to meet with disappointment." Anxious parents will no doubt look about them for some fountain-head of truth, and may find it in Mr. Roosevelt's "Big Game."

From Rome the cable tells that a German professor has laid before the Italian Government a plan for the excavation of the ancient towns of Locri and Crotona, in Magna Græcia. "The former is famous as the place where the first written code of laws, drawn up by Zaleucus, was promulgated." It was this code which provided that the proposer of a new law should stand forth in the public assembly with a rope about his neck, and that, if the law was rejected, the would-be legislator should be strangled. Tradition reports that a popular chief archon of the city, who had introduced a measure dealing with the proper administration of the aqueducts, the baths, the open wrestling-place, and other public utilities, was in danger of meeting with the prescribed fate, owing to the machinations of his opponents, who were known as the Sable Horsemen, from their undoubted affiliations with Pluto, the king of subterranean ways and means. This astute archon, however, by permitting the plotters to proceed with their schemes to amend the measure out of all recognition, soon placed them in the position of appearing as its virtual authors, over whom in turn the dread fate impended in case of failure. The opposition of the Sable Horsemen thereupon disappeared, and the archon's will was achieved. To this tradition is probably due our common proverb about giving a thief rope enough.

In connection with the humiliation of the unfortunate clergyman who officiated at the unsavory wedding last week, the question must have puzzled many why his services should have been sought at all. One might have thought that a Tammany magistrate would have had just about the holy presence needed to "solemnize" such a marriage. So long as the whole proceeding was confessedly an outrage upon all religious feeling, to say nothing of mere morals, why should even the semblance of religion have been lugged in? True, under the hugger-mugger of our divorce laws, the affair was perfectly legal, but that is no reason for attempting to throw the hollow mockery of a sacred ceremony about it. A common-law marriage would have been sufficient, and much more appropriate. Yet it is well known that the parties to such travesties are usually consumed with anxiety to secure "the blessing of the Church." To get this, they are often as unscrupulous in deceiving ministers about the true state of the case as they are in making the legal arrangements for their revolting unions; and this puts an especial duty of caution and inquiry upon the clergymen to whom they apply to "consecrate" them. In the present instance, of course, the facts were notorious, and the unhappy minister walked into his own discomfiture with his eyes open. A ready knowledge of the Scripture would be an invaluable help to a clergyman so tempted. To an emissary of a man like Corey he could say, "Thy money perish with thee"; or, "Is thy servant a dog that he should do this thing?"

The status of Sunday legislation in this country is somewhat peculiar. Here, for example, action is being taken against the Sunday theatres at the very time when a bill permitting amateur baseball games on Sunday has been advancing at Albany. The sweeping resolutions passed by the Presbyterian General Assembly, last Friday, do not recognize the distinctions which laymen are making more and more between different kinds of Sunday amusements. But two of the new suggestions illustrate how hard it is in these days to set off one day in the week absolutely by itself. The denounced Sunday newspaper, for example, is not a product of Sunday work. Yet the General Assembly sees clearly the "overlapping" principle when it asks colleges and seminaries to omit Monday morning recitations which would require Sunday preparation. It asks employers to pay off their men on Friday, that the temptation of a Saturday night with money in the pocket and a holiday ahead may be removed from the workingman. To protect Sunday completely, in other words, the work of the days before and after must be affected. To persuade the public generally to accept this necessity is the insurmountable difficulty of the Sabbatarian at present.

The Jamestown Exposition has rendered no greater service than the bringing to the United States of the various ambassadors from Japan, official and unofficial. We welcome their presence heartily, not because they come wearing laurels freshly won in campaigns on land and by sea, but because we believe that they are true friends of the United States. We have taken no stock in the jingo talk of some of our newspapers, our military officers, and our consuls, that our next war is to be with Japan, and that we must make of the Pacific an American lake by conquering the Mikado's subjects. That sort of muttering, mischievous and wicked as it is, abounds whenever there is any difference of opinion with another country. It is Germany one day, Japan the next, and it is quite as likely to be little Venezuela, or even England, to-morrow that we must whip on twenty-four hours' notice. Coming as it does immediately after the disgraceful San Francisco school incident, the presence among us of Gen. Kuroki, Baron Ozawa, and Vice-Admiral Ijuin is particularly grateful, since it gives the opportunity to convince them that the mass of the American people by no means sympathize with the Ruef and Schmitz grafters of San Francisco and their obedient School Board. No American can point to-day to a single unfriendly act on the part of the Japanese. The talk of war has been entirely American; it is our navy officers who have insisted upon a strengthening of our Pacific fleet, and some of our representatives in Congress who have done their best to make trouble between the two countries. The Japanese Government is bent on establishing peaceful relations with every country. Her relations with Russia are in a satisfactory condition, as has appeared from the recent successful negotiations. Besides her English alliance, by the aid of British influence Japan has concluded one with France, with the purpose of preserving the territorial *status quo* in

Asia and, as M. Pichon, the French Minister of Foreign Affairs, has recently stated, of "establishing new bonds for the maintenance of peace in the Far East."

The first Austrian elections, last week, on the basis of full manhood suffrage must be written down as another victory for democratic principles. The elections were orderly throughout, despite the great excitement, and there seems to have been a large vote cast by the workingmen. As a result, the Socialists and Christian Socialists have shown great strength, while the racial candidates, both Czech and German, have been defeated in all directions. If this means that much of the clashing of the various races has been artificial, the Empire has gained mightily by this test of public opinion. Especially should the defeat of the Pan-Germanic leaders end a fruitless agitation from which nothing was to be gained. What Austria has needed for a long time is the quiet to work out its own peculiar economic and industrial problems free from race antagonisms. So far as the success of the two Socialist parties is concerned, the situation there is much like that in Germany, where the Liberal idea has also been pushed into the background by Socialistic principles. Liberalism has yet to find the leaders to guide the voters along truly democratic lines. But the time is certain to come when this will be the case. One curious fact noted is that 50,000 electors in the province of Lower Austria, which includes the capital, abstained from voting, despite the law, which makes the exercise of the franchise compulsory. This is the system which prevails in Belgium, and is regarded as working with success there. Its introduction in Austria is attributed by the *Frankfurter Zeitung* to the Christian Socialists, with the intent of bringing out their prosperous stay-at-home voters. The results indicate the rather imperfect working of the compulsory-voting law. But, then, all beginnings are hard, and Vienna is an eminently pleasure-loving city.

Every now and then some one of distinction rises to protest against the steadily increasing number of foreign students at the German universities. The latest to complain is Herr von Arnim, who uttered his fears in the Prussian House of Delegates. The foreigners, it seems, take the best places at lectures, which they attend with really censurable regularity. They remain in residence during vacations in order to get on with their studies, and in many cases show as regrettable a purpose to get ahead of their German fellow-students as that displayed by the women in our coeducational institutions to outdo their men rivals. Fortunately, the Minister of Education, Herr von Studt, was on hand to reply to Herr von Arnim, which he did vigorously, and with genuine breadth of view. He rejected every proposal to limit German universities to Germans only. Even the proposed increased tax upon foreigners he opposed. The truth is that Germany's high position as instructor of the world's teachers is one of her greatest assets, a genuine source of pride. Where visiting students misbehave, there is always the university discipline to fall back upon; and, if lecture rooms are overcrowded, other arrangements can be made. Some of the Russian students who crowd German classrooms because of the intermittent activities of their own universities, are doubtless undeserving a welcome, being concerned more with political agitation than their studies. But this is no reason for depriving worthy students from all the world of the privilege of listening to the great German thinkers of the day.

It is scarcely right to say that the Duma declared on Monday against terrorism, when it adopted a resolution condemning the widely ramified conspiracy against the life of the Czar, which M. Stolypin's secret police are said to have unearthed. A vote on the abstract question of terrorism, embodied in various resolutions now before the Duma, has not as yet been taken. The outsider must be not a little puzzled at the evident importance which both parties in Russia attach to an academic declaration about a mode of political warfare which has its cause in desperately unacademic conditions. But in reality the question is a very practical one. There is a widening gulf between the extreme Left and the Constitutional Democrats. The latter have, by their moderate policy, pretty well assumed the character of a party of the Centre. In theory always opposed to violence, they nevertheless condoned it in practice, even as many otherwise peace-loving people outside of Russia have come to regard it as an inevitable evil. Could the Liberals be brought to abjure terrorism even in theory? That would constitute a triumph for M. Stolypin's policy, and even render possible the formation of a solid governmental majority in the Duma. The declaration was made easier for the Constitutional Democrats by having the resolution turn on the question of personal loyalty to the Czar. A conspiracy, in these troublous times, could undoubtedly be had as an excuse—and Monday's vote was the result. That the Left abstained entirely from voting does not militate against the ministerial policy in the least. For undoubtedly M. Stolypin feels himself capable of dealing with terrorism from the Left, provided he has the moderate Liberals on his side.

Apparently, the Russians and the Japanese are testing the maxim that the pen is mightier than the sword. Rival newspapers are being established by them in the former war territory. At Harbin there is a periodical published in the Chinese language with the title *The Far East*, the object of which is to acquaint the natives with Russian ideas. A German correspondent at Yokohama relates that early in the year Russian emissaries visited Peking in search of editors for two more newspapers to be issued for the edification of the Manchus and Mongolians. The Japanese, on their part, print a considerable number of newspapers in Chinese, and these are in the hands of shrewd, expert journalists. Nor is Korea neglected. For some time the Government at Tokio has looked askance at an Anglo-American missionary journal published in that country, which severely attacks Japanese rule in Korea. To counteract its influence, a well-known journalist, Mr. Zumoto, has been sent there to issue the Seul *Press*.

The protest of the wine growers in southern France against conditions which are threatening their industry with ruin, is pretty sure to receive the attention of the Government. On the face of the reports, the problem the Cabinet will have to face is one involving a conflict of interests between the grape growers of the south and the northern beet-sugar farmers; and no matter what be the merits of the case, the Midi must be heard. Not so powerful as it was three years ago, when the *méridionaux* Emile Combes, Jean Jaurès, and Camille Pelletan ruled the destinies of the republic, the south still exercises a great influence in the Government. It is the stronghold of the Radical and Socialist movement and of anti-clerical feeling; and at this very moment its leaders under the same Combes, Pelletan, and Jaurès are actively encompassing the fall of the "reactionary" Cabinet, headed by the astute Breton Clemenceau and the equally sagacious Norman Briand. The discontent of a whole countryside, attested by such vast assemblages as that at Perpignan, or last week's at Béziers, must add to the driving force behind the dissatisfied southern contingent in the Chamber of Deputies. The peaceful nature of the present agitation is only another illustration of how fast France is learning the lesson of self-control under democracy. That more than 100,000 fiery sons of the south, whose everyday table-gestures are sufficient to impress the stranger with the imminence of panic and sudden death, should gather, protest, and disperse without creating an opening for the intervention of the police, argues commendable self-control.

THE BULWARKS OF PROPERTY.

We imagine that few who had followed closely the testimony before the Special Master, in the matter of the 80-cent gas law, were surprised at his finding in favor of the Consolidated Gas Company of New York. The case presented by the Company was, *prima facie*, very strong. Indeed, it has been no secret that, after the array of evidence going to show the actual value of the Consolidated's plant, and the real cost of its manufactured product, some of those most active in working for the 80-cent rate had become convinced that that figure was too low. One of them is reported to have said that a mistake had been made; that a 90-cent rate could have been defended, but that the courts were nearly certain to upset the other. This now appears in a fair way to be done.

Of course, the report of the Special Master, Mr. Masten, is in no sense final or binding. It does, however, carry with it a strong presumption that it will be confirmed by the courts. An appeal will doubtless be taken to the Supreme Court of the United States, from which a decision may be expected within a twelvemonth. It is highly desirable that the issues should be argued before the court of last resort, because the principles involved go to the root of the whole question of the protection of property from legislative invasion. Mr. Masten's report is not yet accessible in full, but it seems clear that the grounds of his decision are Constitutional—that is, that the enforcement of an 80-cent rate for gas would deprive the Company of a reasonable return on its investment, and so would be a taking of its property without due process of law. If the facts establish to the satisfaction of the Supreme Court that such is the case, then the protection of the Fourteenth Amendment should be extended to the Consolidated Gas Company as carefully as to the poorest widow, whose tiny holding of land could not be taken by the State without just compensation.

The whole case illustrates most happily and reassuringly the truth that firm bulwarks of law still make secure, in this country, the rights of property. This gas litigation has been conducted on principles embedded in the legal foundations of our government; and no railway-rate laws, or public utilities bills, can go counter to them. The courts will always intervene to uphold a corporation, or a private citizen, in the lawful use of property, and in the enjoyment of its fruits. According to repeated decisions of the Supreme Court, the fruits of property *are* property; so that no law of Congress, or act of a Legislature, can destroy the right to a reasonable income upon capital. Nor can the power of courts to inquire into any alleged violation of property rights be denied or curtailed. It is inherent in the very conception of a court of justice. Thus it really makes very little difference—except as bearing on the question of the Constitutionality of the bill—whether the specific guarantee of a "court review" be put into a railway-rate bill, or a public utilities bill. The power is there, whether recognized or not, and will surely be exercised by any upright judge to whom appeal is made.

Two tests may be applied in any litigated case. The first is that of Constitutionality; the second that of remuneration. When the first can be shown clearly to be involved, the question is ended. Property cannot be taken by the nation or by any State without compensation; and the imposition, on a railway or a gas company, of rates that prevent it from earning a reasonable income, is a deprivation of property, and hence forbidden by the Fourteenth Amendment. When it comes to the further question, what constitutes a reasonable income, the matter becomes more intricate. We will only note the holding of the courts that the income must be figured upon the actual capital invested, not upon what it would now cost to reproduce a plant or a railway; and that it must also be determined by the nature and cost of the service rendered. No one fixed rate of return can be insisted upon. A barely remunerative rate of income for a given service might, as Judge Brewer pointed out in Catling v. Kansas City Stock Yards, "by reason of the multitude" of transactions, make "the aggregate of profits large"; but in such a case the charges could not be deemed unreasonable. There is also a discrimination to be made between public and private companies. The reasonable income of the former can be more fairly regulated by law than can that of the latter. Indeed, Judge Brewer, in the case cited, suggested that only the Constitutional test be applied to public-service corporations, while the remuneration test be reserved for private business. This would naturally tend to the fixing of a recognized rate of income for corporations "affected with a public interest." Apparently, in the gas case, the Master has reckoned it at 6 per cent.

One moot point in Mr. Masten's report is his reckoning the value of the Consolidated's franchise at $20,000,000. It is probably worth all of that. The State, it was put in evidence, assesses a franchise-tax upon it on a basis of $32,000,000. Yet it may well be doubted if a capitalized franchise ought to be made the ground for a charge to the public. It certainly cannot be so made in this State after the passage of the Public Utilities bill. That measure has a clause forbidding "the capitalization of any franchise, or the right to own, operate, or enjoy any franchise whatsoever, in excess of the amount actually paid to the State, or to a political subdivision thereof, as the consideration for the grant of such franchise or right." That principle we believe to be sound. A franchise is a piece of property; it can be sold; it can be taxed; it cannot be taken away without compensation; yet it must not be capitalized in order to render greater the charges for a public service. Probably the law, as it stands, would not compel the Consolidated Gas Company so to omit its franchise from capitalization; but after the enactment of the Public Utilities bill, all future public-service corporations will be, in that respect, upon a new legal basis.

In any event, we have in this important case a timely reminder of the safety of the system under which we live. With written Constitutional guarantees beyond the reach of hasty legislators, and with a pure and independent judiciary ready to set aside wanton attacks upon property, men conscious of exercising their property rights within the law need not live in dread of the agitator or demagogue.

OUR FOREIGN TARIFF RELATIONS.

The Reichstag last week adopted the provisional tariff agreement with the United States—not, however, without some mutterings. Conservative and Anti-Semite members voted against it on the second reading, while in committee the vote was 20 to 8. Count von Posadowsky, the Vice-Chancellor, in urging for the Government the ratification of the *modus vivendi*, admitted that many members would be disappointed by it, and that its advantages pertained almost exclusively to matters of administration. By these, many just grievances would be removed. At best, however, the Vice-Chancellor considered the agreement merely a stepping stone. The United States ought to realize that Germany was one of their best customers, and that the American tariff was much too high. So he hoped that further negotiations looking to a better and a permanent arrangement would be undertaken at once.

That Count von Posadowsky correctly expressed the views of German industrialists was immediately made plain by the publication in the *Frankfurter Zeitung* of a number of interviews with Saxon manufacturers, all of whom emphasized the temporary nature of this agreement. Writing in the Berlin *Tageblatt*, Ludwig Max Goldberger, author of a book on America entitled "The Land of Unlimited Possibilities," and a member of the Central Industrial Committee, takes a somewhat different tone. He warns his "good friends on the other side of the ocean" that German complaisance has its limits. His countrymen have made many concessions out of deference to our political conditions, but he is inclined to think

that anything further would be regarded by Americans as a confession of weakness. Hence he wishes America to understand that the German worm may yet turn. Herr Goldberger is particularly dissatisfied with the measure which provides for the automatic renewal of the *modus vivendi* on the first of July of each year, if neither party to it has given six months' notice of abrogation. Meanwhile, he insists, everything should be done to make the leading American Senators and Representatives understand that Germany will not be satisfied until both nations are giving each other the most favorable tariff treatment possible.

Now, Germany is a great manufacturing state, whose industrial conditions would be gravely disarranged by a tariff war with the United States. The shrewdest German observers admit this; Herr Goldberger confesses that such hostilities would result in wounds on his side of the water which could be healed only with the greatest difficulty. The leading journal of the German textile trade recently pointed out the great difference which exists between Germany's exports and those of the United States. America, it said,

> sends to Germany about ninety-three per cent. of the total in the form of raw materials and cereals, which we urgently need and most of which we cannot procure elsewhere. On the other hand we export to America only finished goods, as to which, if any cogent reasons existed, that country could be quite independent of Germany. We have, therefore, every reason for avoiding a tariff war with America and for making every effort to prevent any reduction of our business with that country.

The Commercial Treaty Association and other important business organizations have long since expressed similar views, as have the more liberal newspapers. And Germany has not forgotten her bitter experience in losing trade of several million dollars a year with Canada through her attempt to penalize that country for giving a preference to Great Britain.

But the mere fact that Germany is, so to speak, at our mercy is all the more reason why public opinion in this country should assert itself and compel Congress to act. We should welcome such a campaign as Herr Goldberger suggests, because American manufacturers ought to realize how much more readily they could enter German markets under other arrangements, and how unfair is the refusal of Congress to meet the Emperor's Government half-way. Even if Germany has so much at stake as to make it practically impossible for her to risk a tariff war, the feeling of being deeply wronged remains. That is in itself harmful to the further expansion of the business of the two nations; more than that, it makes for international friction and dislike. The German knows that seven European countries, including Austria, Belgium, Italy, Russia, and Switzerland, have recently negotiated fresh reciprocity treaties with his country. He is unfamiliar with the way in which certain of our protected interests rule the Republican party in the interest of their own pockets; and he therefore attributes the unwillingness of Congress to consider a treaty with Germany to some form of hostility.

Again, how our obstinate refusal to treat with Canada in a business-like way has repelled that country, was told last Thursday evening, at the Canadian Club dinner, by Speaker Sutherland of the House of Commons. When there was reciprocity between the two countries from 1854 to 1866, trade grew from $20,000,000 to $80,000,000 a year. But now, although, as Mr. Sutherland said, he and all Canadians "have the most friendly feeling for the United States, and there are many ties to bind us together, we have, after repeated efforts to get better trade relations with you, given it up as a bad job, and have drifted off to trade with other nations." He added a warning that even present conditions could not last. Here again is the clearest illustration of the way our dog-in-the-manger tariff policy makes enemies for us. Of what avail are peace congresses and speeches about our pacific intentions towards all nations, if we persistently run counter to the currents of peace and friendliness through trade?

THE PRICE OF WHEAT.

An advance in the wheat market so violent as was that of last week is a matter of public interest for more than one reason. That a sustained rise in the price of flour and other breadstuffs, coming on top of the recent rapid increase in the cost of all other items of household expenditure, would touch very closely a good part of the community, hardly needs to be pointed out. The London *Economist* has during many years published regularly a so-called "index number," giving the sum of prices of various commodities selected as typical factors in the cost of living. At the end of April this "index number" stood at the highest level in almost exactly thirty years. The figure given was 2549, which compared with 2499 last December, and with only 2211 in the middle of 1900, when commodity prices had reached a height very commonly complained of as intolerable. Yet when this compilation at the close of last month was made, the wholesale cash price of wheat on the New York market was 88⅛ cents per bushel, and of flour $4.50 per barrel. Last Friday the same commodities were quoted, respectively, at $1.04¾ and $5.70.

Independently of the simple question of rise in the cost of living, the wheat market's action, especially during the past week, is itself an index of much significance in its bearing on the question of our trade prosperity. Rapid advance in wheat—the price of contracts for future delivery, at Chicago, went up no less than 12 cents a bushel last week—necessarily reflects an expected reduction in the world's harvest for the coming season. Such a reduction does not always mean that American producers and carriers will suffer; exactly the contrary is sometimes true. The rise of the Chicago price from 81½ cents a bushel to $1.33 in 1879, and from 71 cents to $1.09 in 1897, was in each case a response to crop shortage in Europe, coinciding with an abundant yield at home; it resulted, therefore, in unusual profits to the American farmer, large business to the railways which carried the grain from farm to seaport, and a very great increase in the export trade of the United States.

On both of those occasions, therefore, it was possible to say that the rise in wheat was an index of American prosperity. In 1896, the advance in wheat, from 55 cents in midsummer to the neighborhood of a dollar per bushel in November, was so far from a recognized calamity that it checkmated a good part of the Bryan campaign, and upset the chief argument of the economic agitators. That remarkable advance was chiefly a consequence of the shortage of India's crop and England's consequent urgent bid for our export trade; it was a timely and very tangible proof that profits of wheat-growers were not, as Bryan and his friends alleged, bound up with the rise or fall in silver.

The present month's spectacular advance in wheat, however, can hardly be classed with that of the years just mentioned. Primarily, its cause has been the doubtful prospects of our own wheat crop of 1907. The Agricultural Department's own monthly estimate of May 10, on the country's wheat acreage and condition, indicated that 11 per cent. of the acreage of winter wheat, which makes up the greater part of the American crop, had been abandoned because of unfavorable weather, and that what was left promised a yield 88,800,000 bushels less than what was predicted a month before, and 87,000,000 less than what was harvested in 1906. Meantime, the abnormally cold and unseasonable spring had delayed so long the planting of wheat in our own Northwest and in Canada that it was doubtful if that part of the crop could come up to recent expectations, or approach last year's satisfactory harvest. While all this was happening in America, an almost precisely similar season in Europe, with snow in France and hailstorms in Germany at the end of April, has caused foreign wheat-growers to take an equally gloomy view of their own crop outlook.

A world-wide shortage in grain would

be an event not witnessed in this generation, and a general misfortune. It is reasonable, however, to take the more pessimistic predictions, made at so early a point in the season, with much allowance. It is very seldom that damage to the whole world's crops, occurring in or before the first weeks in May, can be so serious that it may not be in large degree repaired by subsequent favorable weather. It therefore follows that an advance in wheat, to such prices as last week's, may at least be called premature; and, as a matter of fact, it is perfectly well recognized, even on the floor of the Chicago Board of Trade, that actual "crop news" has probably had less to do with the violence of this rise than the keenness of the public appetite for speculation. It did not require even the foolish and disastrous Stock Exchange speculation of last winter to prove that a wild boom in prices, during a distinctly speculative period, may be due more to psychological than to economic causes.

Nevertheless, the events in the wheat market, backed up as they are by ascertained and important facts, are in the nature of a warning, and as such they serve, in our judgment, a useful purpose. We do not suppose it to be as true of the past few months, as it was of the craze of 1901, that our financiers have paved the way to trouble by persuading themselves that the country's industrial welfare was no longer identified with its agricultural fortunes. But even if our speculating millionaires have learned, since then, that the fruits of the earth have somewhat more to do, in promoting prosperity, than the output of corporation printing presses, they have nevertheless refused to take into their reckoning such possibilities as an awkward accident of Nature. After such an episode as that of last winter, it cannot be altogether unwholesome if Nature herself gives them a sharp reminder.

DIFFICULTIES OF THE ENGLISH LIBERALS.

With the Colonial Conference closing in something like rancor, and with the Irish bill rejected by the Nationalists in their Dublin convention, it cannot be said that the prospects of the Liberal Government are exactly roseate. It has, of course, its big majority still intact, and it can hold itself in office three years more, undoubtedly; but merely marking time, and reducing itself to the grade of an old public functionary, will never do for the Liberal party. It came into power backed by too many ardent hopes, and pledged to too explicit a programme, to be content with that. Campbell-Bannerman feels behind him the push of striving and discontented elements which he is bound to try to satisfy. The Labor Party and the Radical Liberals are demanding land legislation; and the alert Winston Churchill is making himself the spokesman of the cry for small holdings. The education question will have to be tackled again; the Ministry is under bonds to propose some sort of reform of the House of Lords; and the Irish are an ever-present trouble. Certainly the English Liberals do not lack for "problems." Those of them who are most gluttonous for difficult work cannot complain that their skill and energy are not sufficiently called upon.

The greatest of all their difficulties remains to be mentioned. They cannot fight their opponents on equal terms. Mr. Balfour holds all their legislation in the hollow of his hand, because he holds the House of Lords in the hollow of his hand. When the Irish bill was introduced the other day, for example, the dispatches stated that there had been high hopes that Mr. Balfour would not denounce so moderate a measure. He did, however, fall upon it savagely, and that was at once taken as an indication that the Lords would never allow it to become a law. Leading but a pitiful minority in the Commons, Balfour is thus able to say what bills shall, and what shall not, be enacted. This is the anomalous position, under a government professedly by party, which fills the Liberals with a sense of unfair play. When the Conservatives are in power, all their legislation, even that designed to placate the Irish, slips through the Lords easily; but when there is a Liberal Ministry, with a majority of even 250, the Conservative leader can hold up his hand and wreck successively and sardonically all its important measures.

Of course, there is a short and sharp and wholly Constitutional way of dealing with this *impasse*. The Liberals could, on the throwing out of any of their bills by the Lords, take an instant appeal to the country, and then, if they came back with a majority, could demand the acceptance of the measure in question, with the threat in reserve to create enough new Peers to ensure it. This, it is pretty well understood, was Gladstone's idea of what should be done when the Lords rejected his second Irish Home Rule bill in 1893. But he was very old, and could not hope long to lead the fight; and Rosebery and the other Liberals thought that the party ought to swallow its discomfiture and hold on in order to work at the rest of its programme. It did continue a precarious existence in office for a couple of years, when it went out of power for ten, with the House of Lords more firmly established than ever as the sworn ally and best political asset of the Conservative party.

There is much talk now of making a square issue with the Lords, and having the fight out at once. Some of the formidable obstacles to that course are pointed out by that stout Liberal, Mr. J. A. Spender, writing in the *Contemporary*. There is, in the first place, the enormous labor and expense of going into another general election so soon as two years after the last one. Candidates would rebel; the needed party funds it would be hard to secure. Then there is another class of considerations. Some Liberals say it would be playing the Conservatives' game rashly to challenge a dissolution so soon. Despite the hostile Lords, the Liberal Ministry can manage to write a part of its programme into legislation. It can pass its budgets; and they are safe from meddling by the Lords. But the budgets themselves can be made to embody a good deal of Liberal policy. They illustrate the desire for peace, for economy, for rearranging equitably the burdens of taxation, and for making a beginning of an old-age pension scheme. Why break off that work prematurely to risk an electoral battle? Then there is the question of foreign relations and wise colonial development. Here, too, the Liberals have ideas of their own, and have been carrying them out with considerable success. They have given the Transvaal self-government. They have strengthened friendships and knit closer the bonds of peace with all European nations. Can it be the duty of Liberals to hazard all this by forcing an early general election? Is it not, rather, distinctly their duty not to imperil the work to which they have set their hands?

To such questions the Tories will, of course, reply tauntingly that they indicate merely a desire to cling to the sweets of office. They will call Campbell-Bannerman's policy one of letting I dare not wait upon I would. And they can undoubtedly point to some signs that the country is growing a little cold to the Liberals. The bye-elections have shown, on the whole, a pretty strong drift against the Government. But this is an old story. It is an English proverb that Governments seldom, but the Opposition nearly always, command the confidence of the country. And hence there would be an inevitable lurking fear that, if the Liberals turned angrily upon the Lords and went to the country, they might return beaten, or else so reduced in strength that they would have gained nothing. The ground would have to be very carefully chosen for a contest of that kind. Certainly, no bill now in sight would be fitted for such a putting everything to the touch. If a popular measure for land-law reform should be thrown out by the Lords, the desired *casus belli* might be furnished; but, short of that, we are not likely to see the Government resort to extreme measures. It will probably go on much as before, getting a percentage of its bills through, and making wry faces

over those which the Lords will not have.

THE HERO WITH THE ARTISTIC TEMPERAMENT.

It would be difficult to find two eminent European writers of the present day who present a stronger general contrast than was embodied in the two leading men of letters whom France has just lost—André Theuriet and Karl Joris Huysmans. Something of the difference between them is suggested when we state that one was a member of the French Academy and the other a member of the Académie des Goncourt; and the whole case may not unfairly be summarized by saying that Theuriet was one of the few French writers of the present time whose books an Anglo-Saxon publisher might venture to translate without danger of iucurring bankruptcy, while Huysmans's work was quite as gross as popular Anglo-Saxon opinion takes contemporary French fiction to be. Which was the greater artist of the two? A few years ago the decision would have been definitely for the grewsome narrator of the extreme in "naturalism," sorcery, and pietistic devotion, and against the poet of the open fields and romancer of quiet bourgeois life. The post-mortem tributes of the French press to Huysmans have not reached us as yet; but from the judgment which eminent men have already passed on Theuriet, it is not hazardous to conclude that the cause of the normal and the objective has been making its way against the morbid and the subjective in Continental literature.

There can be no denying an author's right to study neurology and "temperament" as against life in the placid form if he so desires; but there is certainly room for objecting to philosophies of life so deduced being advanced as of universal validity. French literature is by no means alone in its fondness for the artist hero; German fiction, if anything, surpasses it in its plenitude of Hamlet painters, Don Quixote musicians, and Chatterton *littérateurs* who go crashing down to destruction beneath the ruin of the world's conventions which they are able to overthrow, but not to escape. In Italy, D'Annunzio plainly announces that the heroes of his Triumphs of Death, his Fires, and his Pleasures, are only himself swayed by the eternal forces of "sex, love, passion, and death." And we can rise still higher to Ibsen. His master builders and sculptors who awaken when they die, are the sport of influences to which the coarser souls of most of us, mere candidates for the position of *Untermensch*, are quite insensible.

From this glorification of the professional artist-hero certain signs indicate that a definite reaction is now under way. German fiction is still plentifully supplied with the histories of painter Euphorions and their incompatible wives, and of great novels that are written in the heart's blood, or that are destroyed after being written because the great tragédienne who was their inspiration proves fickle, or goes away to the Riviera with the leading tenor. The type persists, but its importance is diminishing, and we have a marked drift away from these specialized souls to the broader sweep and infinitely more elemental conditions of a Gustav Frenssen, or, in Italy, Antonio Fogazzaro. In France, too, it is significant that the popular dramatists, like Brieux, Capus, Lavedan, and Mirbeau, nowadays choose their topics from among the problems of unexceptional life, and that novelists like Barrès and Bazin, instead of coddling their souls as incubators for rare sensations, have turned to study their fellow-citizens and their country.

The protest against the abnormal in art is cleverly voiced by the author of a fable in a recent number of the Paris *Temps*. A young American millionaire is represented as coming to Paris, impelled by the desire to satisfy the vague longings of a lofty soul. The ordinary pleasures that the French capital has to offer fail utterly to attract him, and, disappointed, he is about to leave the city without having found a purpose in life for himself or his vast millions, when he happens to stroll into a salon of paintings by "progressive" artists. As he stands completely bewildered before a triumph of radical impressionism, a voice behind him sighs out, "*Ah, comme c'est beau!*" When the young American asks wherein lies the beauty beyond his grasp, the stranger, who turns out to be a noted *jeune* art critic, tells him that if he cannot see beauty of himself, it is useless to attempt explanations. "I will buy this," says the rich youth; and thereafter, under the guidauce of the same mentor, he continues to buy till the studios of all the "advanced" painters in Paris are denuded. But as he purchases canvases, he also acquires his education, and the climax comes one night when the young millionaire invites all the "independent" artists and critics to a splendid fête at his château. He orders a great bonfire to be lighted, and before all his guests throws into it his vast stock of paintings, with the solemn words, "For the sake of the beautiful in art!"

THE LITERARY PRODUCTION OF FRANCE IN 1906.

PARIS, May 10.

Information which is instructive as well as interesting may be derived from the last "Table Systématique de la Bibliographie de la France année 1906." This classifies the titles of all the copyright publications of the year as registered at the Ministry of the Interior. Only printed matter for private circulation escapes this registration. For example, the society of Freemasons does not register its printed documents nor deposit copies in the Bibliothèque Nationale; consequently, under the head "Freemasonry" only ten titles appear, of which eight belong to books or pamphlets attacking the famous society. But, apart from the few similar cases, the Table furnishes complete data of the literary output of France for an entire year.

Including pamphlets and songs, but not periodicals or sheet music, about 7,900 titles appear. Those for whom the bulk of French literature is constituted by novels will be surprised to learn that the total of novels, romances, and tales amounted only to 340 volumes. On the other hand, 410 plays are registered, 215 books of new French poetry, and 400 volumes of letters, addresses, miscellanies, anecdotes, and criticism coming under the head of French literature. There were 210 translations, prose and verse, from foreign literatures, ancient and modern; and 26 Greek and Latin texts, sometimes accompanied by translations, and including half a dozen books or theses of scholastic theology. The University practice of the Latin thesis for the doctorate of letters is evidently disappearing, as only one title is noted, which happens to belong to our English philology—"Bastide (C.). De Recentiore Gallicorum Verborum Usu in Anglica Lingua."

The high place taken by history in the intellectual life of France is shown by 440 separate works, for the most part real volumes; 450 biographies; and 315 pamphlets, or books dealing with archæology, numismatics, inscriptions, chivalry and nobility, palæography and archives. In the allied branches of geography, ethnography, and ethnology, travel and guide books, there are 225 titles. A large number of the works classified under the military art (270) and marine and navigation, including that of the air (80), are also technical historical studies.

Under the head of religion, which includes everything from the higher criticism of Scripture to the notice of a pilgrim shrine, patrology, church history, saints' lives, theology, Catholics naturally have the immense majority (500 titles). Only twenty-six publications are formally attributed to the Protestant religion, mostly *actualités*; but the official indexer places a translation of Bunyan's "Pilgrim's Progress" under the head of moral philosophy! Oriental religions are credited with ten books, including two on Judaism, and two on the Greek churches. Many of the books showing the religious aspirations or troubles of mind are stowed away under the head of philosophy, mental and moral, which has 180 volumes, while 52 are down for mysticism and occultism.

So far the mere statistics show that the French general reader is not exclusively wrapped up in novels and that the speculative thought of the people is not yet totally enslaved to material science. We now come to departments of intellectual activity where a certain influence of the university monopoly over all liberal professions is shown in a multitude of books printed as theses for the various doctorates. This influence is also felt in history and philosophy, where such theses not sel-

dom add to the permanent treasure of the language. In law, where the doctor's degree is required for nearly all judicial posts, there were 620 publications on legislation, jurisprudence, administrative law, and penitentiary questions. In the various medical sciences 607 books are registered. There are 31 volumes on general mathematics and 32 on astronomy, meteorology, and mechanics. Physics and chemistry have 95 volumes, and there are 65 in natural history, which in France means geology, botany, and zoölogy. Over 200 hooks are devoted to agricultural sciences, including silk and oyster growing.

The official classification under moral and political sciences is rather disconcerting and leads us again from the material to at least semi-spiritual realms; thus "Russia and the Universal Church" and E. Vandervelde's "Socialist Essay" on Religion crop up among the 162 titles of political and social economy. There are 160 works on financial, commercial, and statistical questions; 20 in public administration—and 190 classified as politics, meaning present-day controversy and criticism.

In the fine arts, there are 100 publications on the arts of design, many of historical and critical interest; and there are 24 on music and the dance. There are 210 books on the various industrial arts and engineering; and 20 on domestic economy.

In spite of certain incomprehensihilities of the official classification, it may he said that none of the puhlications so far mentioned directly concern hooks for the uses of students in the schools. These are of great interest, if only hecause of French order and lucidity. To puhlic instruction in general 25 works were devoted; to pedagogy, including anthologies and miscellanies, 130; and there are 225 books of "education and recreation." Of text-hooks proper there are 26 made up of extracts from chosen authors (reading hooks, hut not quite in the American sense). The distrlhution of class hooks among the languages tells a tale of French schools: French has 140, as is natural; Latin 41, Greek 20, then English 26, German 19, Spanish 4, and Italian only 5, and Russian 2, in spite of the alliance. Oriental languages, which comprise French colonies even in the Pacific Ocean, have 13 grammars and so on to their credit. There are 29 class hooks of philosophy to 135 on the sciences; 60 of history and 40 of geography; and 60 hooks are set down to general linguistics, with the new fad of Esperanto responsihle for most of them.

Of unclassifiable matter, the hunt and fishing, races and equitation, exercises and games have 60 entries. There are 22 encyclopædias and reports of academies and learned societies. And bibliography, which is in honor in France, claims 47 copyrighted publications for itself.

Such an annual production of printed matter assuredly shows intense intellectual activity and a general cultivation of the widest scope among a people of fewer than 40,000,000 souls. It may be considered hy some a sign of general over-education. It is certainly due in large measure to the secondary education which is compulsory for all who wish to enter any profession from veterinary to officeholder in the puhllc administrations. Even the higher commercial element of the country comes under this secondary or college education. Whether it is too general or too high and unpractical for the interests of the country is another question; but it is undoubtedly favorable to intensive literary cultivation and production.

S. D.

NEWS FOR BIBLIOPHILES.

The first book on Virginia, Smith's "True Relation," of 1608, was a narrative of events in the Colony itself, and was issued, probably without authority of the Council of Virginia, as a promising speculation by its publisher. The second book was a publication of the Council; its purpose, to induce colonists to emigrate to the new settlement and to augment the sale of the Company's stock, being indicated by the title: "Nova Britannia. Offering Most Excellent fruites by Planting in Virginia. Exciting all such as be well affected to further the same," London, 1609. The book is a thin small quarto of twenty leaves, signatures A, B, C, D, and E, each four leaves, A having only the letter "A" on the recto, and E4 being blank. The title is A2, and the Dedication to Thomas Smith, Treasurer for the Colony of Virginia and Governor of the Company of Muscovie and East India Merchants, signed "R. I.," fills the recto and verso of A3. The text begins on the recto of A4 and ends on the recto of E3. The pages are unnumbered.

The book was entered at Stationers' Hall on the 18th of February, 1609, and it must have been published as early as March 5, as on that day Zuñiga, the Spanish minister in London, who was keeping his home Government well informed about the new ventures to America, wrote to his King, Philip III.:

> They have printed a hook which I also send Your Majesty, in which they call that country New Britain and in which they publish that for the increase of their religion and that it may extend over the whole world, it is right that all should support this Colony with their person and their property. It would be a service rendered to God, that Your Majesty should cut short a swindle and a robbery like this, etc.

The initials "R. I." signed to the dedication are supposed to be those of Robert Johnson, a public-spirited London merchant, member of the Grocers' Company, an incorporator of the East India Company and of the Northwest Passage Company, besides being an adventurer and official in the Virginia Company. He apparently never came to America. He is supposed to have been the author of the hook under discussion, though he does not admit it in the dedication, which calls it "the summe of a private speech or discourse, touching our plantation in Virginia, uttered not long since in London, where some few Adventurers" were met together.

That there were two distinct editions of the pamphlet in 1609 has been known for a long time, but by a comparison of a number of copies we have discovered that the tvpes of the book were set not less than five times, making five (or six) distinct editions, varying generally in minute typographical particulars only. Of the thirteen copies examined, all but one has a cut of a ship in full sail as a vignette on the title-page. This, one of the two copies in the Lenox Library, is without the ship, hut has a head-piece containing the royal arms, and is evidently the earliest form. As copies of the same setting are found with the "ship" title-page, we may presume that this change was made while the first edition was printing. There were, therefore, two issues of the first edition. Only two varieties of the title with the vignette of the ship can be positively distinguished. In one of these "Offering," in the second line, is correctly spelled; in the other it is spelled "Offring."

While positive diffcrences, proving the five settings-up, arc found on every sheet, and on almost every page, it is sufficient for the purpose of distinguishing the edition to take the leaf D4. Lines 20 and 21 of the recto of this leaf contain the only important textual differences, and these may be used as a distinguishing mark of the various editions:

Edition I. Recto, line 20, "vs: As also for euery Planter and Aduenturer shalbe inser-"; recto, line 21, "ted in the Patent by name: This ground beeing laid wee". The first issue of this edition contains the title without the ship. The second issue has the "ship" title.

Edition II. Recto, line 20, "vs: As also cuery Planter and Aduenturer shalbe inser-"; recto, line, 21, "ted in the Patent by name: This ground heeing laid wee".

Edition III. Recto, line 20, "vs: As also euery Planter and Aduenturer shall bee inser-"; recto, line 21, "ted in the Patent by name: This ground being laide, wee"; verso, line 28, "least. Now if any thinke that we shal be tyed to a continual".

Edition IV. Lines 20 and 21 of recto are identical with Edition III.; verso, line 28, "at least. Now if any thinke that we shall be tyed to a conti-".

Edition V. Recto, line 20, "uerne vs"; recto, line 21, "This ground beeing laide, wee purpose presently to".

The last edition, it will he ohseryed, does not contain the sentence: "As also every Planter and Aduenturer shall be inserted in the Patent by name." This is the greatest and only important textual difference among the various editions. The new charter of the company was not signed by the King until May 23, 1609, having been kept open, probahly, in order to allow the insertion of the names of the stockholders. After the charter was signed and sealed it was not possible to incorporate new names. It is probable, therefore, that the first four editions described above were printed between Fehruary 18, when the book was entered for copyright, and May 23, when the new charter was signed, and that the fifth edition (which is the more common one) was printed after this latter date.

That there was great interest in England among all classes in Virginian affairs, in 1609, is shown by the following, written in 1612, by William Strachey:

> Which was once a thing so full of expectaunce (and that not above three years since) as not a yeare of a romain-jubile, no nor the Ethnick Queene of Ephesus, can be said to have beene followed with more heate and zeale; the discourse and visitatioun of yt tooke up all meetings, times, terms, all degrees, all purses, and such throngs and concourse of personal undertakers, as the aire seemed not to have more Lights thenn that holie Cause inflamed Spiritts to partake with yt, almost every religious Subject that stood sound indeed at the coare within to Loialtie and to the professioun of the present Faith brought his Free-will-offring, and professed thenn to throw his bread upon those waters.

The widespread interest, probably, made a demand for this publication of the company, and made necessary the printing of five editions in less than as many months.

Correspondence.

THE STATE UNIVERSITY OF MAINE.

To the Editor of The Nation:

Sir: The opposition of denominational colleges supported by private endowment to the growth and prosperity of the State universities supported by public funds from the State and the United States Government has long been a familiar phenomenon in the South and West, where it is now dying out, partly because it is seen to be useless, and partly because the supposed dangers to the smaller colleges looked for in the growth of the State institutions have proved in the lapse of time imaginary. The State universities have grown great indeed; but the colleges have grown also, their patrons have not forsaken them, their benefactors have kept on endowing them, those who preferred them have received there their education. Familiar examples are North Carolina, Wisconsin, Michigan, Illinois, and Maine itself, not to cite many others. This is the right result of the founding and development of the State institution; for in the case of "land grant colleges" their charters were based on Senator Morrill's bill expressly providing that the character of the instruction should be not merely technical, but general and liberal; and the only rational principle that can be defended for a State university is that any and all the youth, of both sexes, in the State, shall be offered such kinds of education as they may desire.

Of this question but little was known in New England until within comparatively recent times. In Maine it arose ten years ago, on the establishment of the course leading to the degree of A.B.; and the contest in the recent Legislature was merely an attempt on the part of the friends of the three other colleges in the State (two Baptist and one Congregationalist) to reduce the university to a technical school by removing the departments that make possible the giving there of an arts course. Your correspondent in the issue of May 2d is hardly correct in saying that the "Maine Legislature has temporarily disposed of a question of broad educational interest"; when it has been settled pretty much everywhere else but in Maine, and there appears permanently settled by the action of the Legislature reaffirming the position already repeatedly taken. Certainly his statement of the "question" would seem to have been written in ignorance of educational history in this country; for, while it is hardly to be thought that any State has deliberately wished to "compete" with any existing educational institution in the establishment of the various colleges and universities, the fact of possible competition has long since been accepted as an educational commonplace in nearly every State in the Union. But the educational impetus and inspiration coming from the great growth of the State institutions has been a blessing to the denominational colleges in many ways, and the jealousy which the latter have so unfortunately manifested has been all too groundless, and has done little credit to the ideals that should prevail in the older academic circles.

Maine is not "demanding the public funds for a college of liberal arts." The small additional amount required for those classical departments which alone are concerned was from the start paid out of other funds, and even that expense was materially diminished by the income from the students attracted by these courses. For the other courses in line for the arts degree must be given just the same in connection with other degrees. Even if the total expense of supporting the classical departments in the University of Maine were to come out of the pockets of the impoverished and long-suffering taxpayers of Maine, it would not cost the said abused taxpayers three cents apiece!

The implication that an inferior article of education is dispensed at Maine in the liberal arts courses is equally erroneous. Comparisons are odious; but if anybody thinks it necessary to prove the above statement by comparison, the catalogues of the various institutions are easily accessible, wherein may be seen what facilities for classical study are afforded at each.

It does sound absurd, on the face of it, to be "advertising in the papers of Massachusetts to secure boys to take an A.B. course at the expense of the taxpayers of Maine." But when the facts are examined, the statement seems even more absurd. Very little advertising is done in Massachusetts papers by the University of Maine, and very few A.B. course students go to Maine from Massachusetts. But, so far from being at the expense of the taxpayers of Maine, the coming of students from Massachusetts to the university is easily seen to be a profitable thing for Maine. The additional cost for the additional students in courses already established is trifling, but the money brought to Maine by students from Massachusetts this year exceeds $20,000, about half of which goes directly to the university, and the rest to the "taxpayers."

One other fallacy needs to be exposed, one familiar to the writer during years spent in North Carolina, where the denominational colleges wasted much good strength in opposing the State University, namely, the idea that by cutting off some branches of the tree of higher education, there would be more available sap for the trunk of common school education. How often it has been shown by simple statistics that there is nothing in it but a specious plea! If all the money, for instance, that is spent on the departments of Greek and Latin in the University of Maine were divided among the schoolteachers of that State, it would not suffice to buy them each a new hat!

Karl Pomeroy Harrington.

Middletown, Conn., May 13.

WHERE WAS NOVA BELGIA?

To the Editor of The Nation:

Where was Nova Belgia? The question if addressed to an American antiquary or historian will seem to admit of only one answer. De Laet's map of "Nova Anglia, Novum Belgium et Virginia" (1630) and Blaeu's map of "Nova Belgica et Anglia Nova" (1636), and Allard's map, entitled "Totius Neobelgii . . . tabula" (1673) appear to furnish sufficient evidence of the use of such a Latin phrase for the Dutch settlement which is now New York.

Turning from maps to books, what are we to conclude as to the place of printing of the little work the title page of which runs thus: "An / Arrow / Against / Idolatry / Taken out of the Quiver / of the / Lord of Hosts / By Henry Ainsworth / Psalm 119, 31 / I cleave to thy Testimonies: Lord, let me / not be ashamed / Nova Belgia. Printed 1640"?

The book is now a rare one; of the only two copies I have seen one is in the British Museum, and the other lies before me in its original binding, as I write. It is a small volume (5¾x3¾ inches) of 121 pages, not badly printed, but without any special typographical distinction.

The author, Henry Ainsworth, was long considered a Lancashire man, but he was really born in Swanton Morley, Norfolk, in 1570. He was educated at St. John's College, and Gonville and Caius College, Cambridge, but it does not appear that he ever graduated. In so recent a book as Dale's "History of English Congregationalism" (1907) it is said to be doubtful if he had been to a university. This is probably based on a statement of Roger Williams, who says "that most despised (while living), and now much honoured Mr. Ainsworth had scarce his peer amongst a thousand academicians, and yet he had scarce set foot within a college walls." The Admission Register of Caius shows that he was admitted a scholar there December 15, 1587, and had then been at St. John's for a year. He was a fine type of the Puritan; learned, earnest, and uncompromising. As an Independent he had to take his share of persecution, and about 1593 found refuge in Amsterdam, where he worked as a porter in a bookshop and lived "upon ninepence a week and some boiled roots." With others like-minded he founded a congregational church, but the brethren could not live together in unity and quarrels arose on various matters. Some of them were troubled as to the apparel of the wife of Francis Johnson, the pastor. She had it appears "bodies tied to the petticoats with points as men do their doublets to their hose contrary to I. Thess. v. 22 conferred with Deut. xxii. 5, and I. John ii. 16." The reader who remembers, or refers to, these verses will have before him the whole Puritan theology of "points." A more serious division was the secession of Ainsworth on the question as to whether the power of excommunication belonged to the entire congregation or rested with the officers. In the twelve years of his pastorate Ainsworth wrote a number of theological and controversial works and commentaries. To the last class belongs a translation of the Song of Songs entirely, and indeed pathetically, destitute of all poetic feeling or inspiration. He died at the end of 1622 or beginning of 1623, of renal calculus, though there was an absurd suspicion that he had been poisoned by the Jews after a conference upon the Messianic prophecies in which it was claimed he had confounded the rabbis. It fortunately happens that Nicholas Tulp, the famous physician, has left a detailed account of the disease which carried off the

learned Hebraist, and it conclusively disproves the poison story.

That Massachusetts had a press in 1638 is, of course, well known, but New York is not credited with one until 1693. Is it possible that some disciple of Ainsworth, who had left Holland for Holland's colony, carried over type for the production of an "Arrow Against Idolatry"?

If there was no press at New York, in 1640—and I know of no evidence of the existence beyond the suggestion of the title page here quoted—there remains for solution a bibliographical puzzle: Where was Nova Belgia? WILLIAM E. A. AXON.

Southport, Eng., April 26.

THE KEATS-SHELLEY MEMORIAL.

TO THE EDITOR OF THE NATION:

SIR: I feel sure that many of your readers will be interested to know of the imminent success of the project to establish a Keats-Shelley Memorial in Rome, in the house on the Piazza di Spagna in which Keats died.

The option on this house was secured some months ago at $22,000, and was taken up on the 30th of December, 1906, by a cash payment of $14,000, and a mortgage of $8,000, which has since been reduced by the payment of nearly $5,000. Of this last amount, $4,200 (including $2,000, the proceeds of the Waldorf matinée on February 14) has been raised in this country; $500 was obtained by the entertainment at the Duke of Sutherland's, Stafford House, on March 20, and $165 has been contributed in Canada. The title of the property is now held by the Keats-Shelley Memorial Association, organized under English law, and having its executive committee in Rome. The opening of the library in the apartment occupied by Keats and Severn is expected to take place in November, by which time these rooms will be rearranged in simple style, and provided with bookcases and other necessary furniture. After the enterprise is fairly established, it will be maintained by the rentals of the other apartments.

Until that time, however, subscriptions will continue to be received:

(1.) For the extinction of the balance on the mortgage, $3,000.

(2.) For the furnishing of the rooms—which it is hoped will be undertaken *en bloc* by some admirer of the poets—say, $1,200.

(3.) For the purchase of the beautiful lately discovered portrait of Shelley, painted by the Kentuckian, William Edward West, two months before the poet's death, but never known to his widow. This portrait, on which the American Committee has a virtual option, has not yet been appraised, but it is hoped that this also will be bought by some one for the library.

(4.) For the purchase of such editions of Keats and Shelley and other appropriate works as may not be presented.

(5.) The gift of a small fireproof safe is also desired.

The English committee is supplementing its labors in collecting some $4,500 toward the fund, by efforts, already successful, to obtain for the library the gift of interesting materials. Sir Charles Dilke will doubtless present one of his three portraits of Keats by Severn—probably the one shown in Lord Houghton's edition—possibly the "standard portrait," the one which Keats gave to Fanny Browne. If we could get the Shelley by West, Sir Charles could thus make sure that the library would have the best portrait of each. He has also given the original of the letter of Severn recording the circumstances of Keats's mention of his desired epitaph. On this side of the Atlantic Mr. John Gilmer Speed, grand-nephew of Keats, has presented two interesting portraits: Severn's water-color of Tom Keats, brother of the poet, and the oil-painting of his sister Fanny by her son, Juan Llanos y Keats, and there is reason to hope that a distinguished American painter will make a copy of the portrait of George, the brother who settled in Kentucky, thus completing the portraits of the four of that generation. Mr. Henry W. Cannon, one of the executive committee, has recently purchased and presented a number of letters of Byron relating to Shelley. When the house is once paid for, a special invitation will be given to owners of MSS. and portraits to make gifts, or at least bequests, to the library.

The American committee will soon send to Rome a considerable number of volumes appropriate to the archives; among them Mr. Woodberry's edition of Shelley, presented by him; copy No. 1 of the limited édition de luxe of Keats and Shelby issued and presented by the publishers, Virtue & Co., and not a few volumes by American poets, presented by request of the committee, and containing poems on Keats or Shelley.

The Stafford House entertainment, mentioned above, had among its distinguished features a most interesting exhibition of objects related to the two poets—a catalogue of which I shall be glad to show to any one. It includes MSS. of the "Ode to a Skylark," and many other poems of Keats, the first draft of the "Adonais" and of other poems of Shelley, with a precious array of volumes owned or written by the two, besides portraits, relics, etc. When the permanent and cosmopolitan character of the Roman memorial is realized, doubtless many of these will be there deposited. In the Roman house they would probably be seen by more English-speaking people—certainly under more sympathetic conditions—than in the British Museum, in the Hampstead Library, or in any institution in America.

I have undertaken to compile for the library a list of similar articles now owned in the United States, which include the MSS. of the "Ode to a Skylark" and the Shelley notebooks, of "Endymion," "Lamia," "Otho" (at least in part), and the "Ode to Autumn," besides Keats's copy of Shakespeare; and I shall be obliged by information concerning others.

Any one desiring to do so may still have a share in this interesting and inspiring memorial by sending to me at No. 33 East Seventeenth Street, New York, a check payable to the order of The Keats-Shelley Memorial Fund. The chairman of the American committee is Mr. E. C. Stedman.

R. U. JOHNSON, Secretary.

New York, May 20.

IAN MACLAREN.

TO THE EDITOR OF THE NATION:

SIR: You rightly say that the interest in Ian Maclaren's fiction has much abated of late, but for my single self I feel that his best work will hold high place as long as the English language endures. I well remember when I first came under the charm of his pen. Against the Scotch dialect I had always felt a strong prejudice, and though I had seen highly praised "Beside the Bonnie Brier Bush," I felt no interest to read it, until a gracious hostess in the Schuylkill valley gave me the volume, as I went to my room, with the kindly injunction to lay aside my prejudices and give it a fair trial. I did so, and soon the scales fell from my eyes. From that time I have always felt and ever shall feel the enthralling spell of the tender pictures of Scottish life. I am sure that I am but one of many thousands to whom his writings are an abiding joy, for whom Scotland and its dialect will have a peculiar charm because of him. An eminent Canadian judge told me recently that his brother, a practising physician in the far Northwest, was known as William MacLure the country round. Once, in making the voyage hither from the Mediterranean, it was my pleasure to read from his writings each day to a dozen or more, gathered from the four quarters of the earth, and representing many walks in life. Yet all, bishop or banker, doctor or student, gray-haired scholar or young girl, yielded readily to the charm of his words.

It is to be remembered that fiction was his avocation, and not his vocation. He wrote his sketches in the leisure hours of a laborious pastorate, where he preached twice on Sunday to one of the largest Presbyterian churches in England, of which he was the only pastor in its history until two years ago. Under such circumstances it is wonderful that his work should be of such high quality; not in invention, but in the portrayal of character. One element of his power that always impresses me I have never seen spoken of in public print: that is, the complete art by which he passes from genial humor to the most tender pathos, without the slightest break or jar upon the feelings of the reader. This is most fully illustrated in one of his stories, "Jamie."

Your rather unsympathetic editorial note on kailyard literature has no allusion to his short stories without Scotch dialect, which are found in the volume entitled "Afterwards." These have been largely overshadowed by his more famous Scotch stories, yet some of them are of unquestioned merit. To my mind, the one which gives its name to the book is a classic; it received the highest praise from Elizabeth Stuart Phelps when it was published in magazine form. Its moral purpose does not interfere with its artistic execution.

Any lover of Ian Maclaren, if he is ever in Scotland, should make a pilgrimage to Drumtochty, where Dr. Watson ministered before he went to Liverpool. Its real name is Logiealmond, and it is easily reached from Perth by the train to Methven Junction, and then by branch line to Methven, which figures in the book as Kildrummie. That delightful character, Peter, the railway guard, in 1896, was run-

ning the train on the short branch. Ian Maclaren bas pictured him to the life, but I fear by this time he has gone to "his lang hame." If he is not yet out of the service, then any friend of Ian Maclaren will be sure to get from him a hearty hand grasp and cordial greetiug in broad Scotch. Then a walk of three miles over the hills will bring the pilgrim to the valley of the Almoud, and the village of simple, God-fearing folk, whom the power of the author has immortalized.

I must conclude this letter with an anecdote of Dr. Watson which, among many pleasant memories that I treasure of him, has an especial charm. In the story, "The Minister of St. Bede's," there is a whole page of description of that charming university town of Germauy, Tübingen, on the Neckar, where Dr. Watson studied theology. It occurs in the letter which Rutherford is writing to his Highland love, Magdalen, about what they will do on their wedding journey. "We'll go to my rooms near the Kirche, where I used to write a letter to you every day, and here is what old Frau Hepzäcker will say, 'Mein Gott, der Schottlander und eiu wunderschönes Mädchen.'" I told Dr. Watson how much I had enjoyed the story, and that I thought this passage an especially happy touch. He turned and looked at me with a radiant smile ou his face, and said: "I am glad you liked that passage; but it is fact, not invention. That is what she did say to me wheu I went there on my honeymoou."

GEORGE L. FOX.

New Haven, Conn., May 12.

Notes.

Fifty more volumes have been added to Everybody's Library of E. P. Dutton & Co., bringing the total number to 200.

The second volume of Bielschowsky's "Life of Goethe," translated by Prof. William A. Cooper, is about to be issued by Putnams.

The Baker & Taylor Co. has in press a new book by the Hon. John Bigelow, entitled "Peace Given as the World Giveth; or The Portsmouth Treaty and its First Year's Fruit."

Houghton, Miffliu & Co. announce two new volumes in their Riverside Press series of special editions. One will contain the "Unpublished Correspondence of David Garrick," edited by Prof. George P. Baker. The other is a reprint of "The Poems of Maria Lowell," which were first published, privately, by her husband, J. R. Lowell, in 1855.

The fifth volume of "The *Times* History of the War in South Africa" is to be ready the last day of this month. It has been written by Erskiue Childers, under the general editorship of Mr. Amery, and covers the whole period of the guerrilla war, from Lord Roberts's march to Komati Poort to the conclusion of peace.

Lemcke & Buechner will import next month the first volume of a series of illustrated monographs on "Die deutschen Hochschulen," edited by Theodor Kappsteln.

Dr. Mark Lidzbarski of the Uuiversity of Kiel, favorably known as an authority ou Semitic epigraphy, has begun the publication of a useful series of texts under the title of Altsemitische Texte (Giessen). He proposes to issue these series in parts of from sixty to seventy pages, each part to contain selected inscriptions—Phœnician, Punic, Aramaic, Arabic, etc.—accompanied by explanatory notes. The feature of the series, of which part 1 has now been issued and seven other parts announced, is the reasouable price of only two marks for each part. The study of ancient Semitic inscriptions has hitherto been rendered difficult owing to the expensive nature of the publications on this subject. Dr. Lidzbarski, by placing the material within the reach of the purse of all students, will no doubt find his reward in the stimulus that will be given through his series to a most important branch of Semitic philology.

Among the French books just published in Paris may be meutioned: "Byron et le Romantisme Français," by Prof. Edmond Estève, on the influence of Byron's works in France from 1812 to 1850; "Philosophie des Parfums," by Charles Régismanset; "La Jeune Littérature Hispano-Américaine," by Manuel Ugarte; "La Littérature Anglo-Canadienne," by M. Henry D. Davray; the poems of Jacques Vallée des Barreaux (highly praised by Voltaire, but, save for a single sonnet, hitherto lost), edited by Frederic Lachèvre; "Le Socialisme Municipal en Angleterre et ses résultats financiers," by Raymond Boverat.

Charles H. Kerr & Co., the Socialist publishers of Chicago, have issued cheap reprints of C. Osborne Ward's "The Ancient Lowly," and Lewis H. Morgan's "Ancient Society."

Gerald Stanley Lee's "Lost Art of Reading" has been reissued by Putnams in two volumes, one retaiuing the earlier title, the other taking the name of "The Child and the Book." We are not admirers of Mr. Lee's spasmodic smartness, but his books have evidently found their audience.

Arundell Esdaile relates an amusing discovery in the *Athenæum*. While looking through at the British Museum a copy of Augustinus de Ancona, "De Summa Potcstate Ecclesiastica," printed at Cologne by Arnold ther Hoernen in 1475, he observed a marginal note evidently written by an English hand of the early sixteenth century in that section of the book which discusses the power of the Church to give dispensation for breaches of the seventh commandment. The text runs: "Ad primum ergo est dicendum quod plures uxores habere non fuit contra naturam in antiquis patribus"; and the marginal note adds: "Ergo nec in nobis." Now this particular copy of the book had been in the library of Henry VIII., and examination seemed to show conclusively that the words had been jotted dowu by the royal sinner's own haud. He had also, by marks and by short headings writteu in the margin, drawn attention to parts of the table of contents of special interest to himself.

The summer meeting of English and foreign students at Oxford will begin this year on August 1 aud end on August 26. According to the programme just issued there will be lectures on the history, literature, science, fine art, and architecture of the seventeeuth century, on social economics, and lectures and classes in the theory and practice of teaching. Some of the subjects in the section devoted to literature and philosophy are "Roger Bacon," "John Wycliff," "The Schoolmen," and "Richard Hooker." A. C. Benson will lecture on "Walter Pater," and Dr. W. Osler on "Burton's Anatomy of Melancholy," Sir John Gorst will discuss "Labor Laws and Labor Conditions in New Zealand," and "Combination and Trade Unions" will be the subject of Mr. E. Horsburgh, while Prof. M. E. Sadler's is "English Ideals of Education, Socialist and Individualist." At one of the conferences the problem of old-age pensious will be discussed.

The twenty-fifth State to establish a State department of public libraries is Missouri, whose General Assembly has just passed a law creating a State Library Commission, and providing for a system of travelling libraries. The act embodies most of the general features of other State commissions, and is to be composed of five persons, two of whom are to be the State superintendent of schools and the president of the State University, the other three to be appointed by the Governor. An appropriation of $10,000 is made for organizing and carrying on the work till the meeting of the next Assembly. The commissioners are to serve without pay, but they are authorized to employ a paid executive and other needed assistants. In one respect the law is in advance of that of any other State, and that is in its specifications for work with schools. The commission is specifically instructed to arrange for courses of lectures on library usage in each of the State Normal Schools, to provide plans for the care of school district libraries, and in general, to promote coöperation between schools and libraries.

A uew public libraries bill, to supersede the famous Ewart act, now in force for more than fifty years, has been formally introduced in the House of Commons and is strongly urged by representatives of the library interest throughout Great Britain. The main provisions of the bill are, to provide for county as well as municipal library systems, to remove the tax limit of one penny on the pound for library support, to exempt public libraries as educational institutions from local taxes, and to legalize the expenditure of public money to provide for lectures or exhibits at the library.

Free circulating libraries are being placed in the elementary schools of Italy through the efforts of a committee founded by Signora Clara Cavalieri of Ferrara aud patronized by the Queen. These libraries consist of from twenty-five to fifty volumes in cheap editions, and the distribution is made by the master with mere registration of the borrowers. From Ferrara the movement has spread to Padua, Bologna, Spezia, Pisa, Leghorn, San Remo, and Turin. This work is especially needed in Italy, for the public libraries are scarcely popular. They serve the studeut class well, but their tone is academic, and their red tape alone makes their use practically impossible for the working classes. To attack "the illiteracy of the literate" in the schools, then, seems to the promoters of this work almost as important as dealing with the 48 per cent. of actual illiterates.

In this connection, Paola Lombrosa of Turin has been studying the intellectual condition of a group of "readers." She found that among them the Constitution was variously defined as "The King's festa," as "The place where the deputies who rule us are," and more doubtfully as "Perhaps a title of the Madonna." Her remedy for this sort of literacy is to introduce the reading of newspapers, with explanations by the master, into the elementary schools. The proposal naturally finds approval with the press.

The *National Geographic Magazine* for May contains as its most valuable article a convincing plea, by H. M. Wilson of the Geological Survey, for the establishment of a Federal drainage service for reclaiming the swamp lands on a basis similar to that of the Reclamation Service for irrigating arid lands. After briefly sketching what has already been accomplished in several States, he shows with the aid of a map and diagram where the sixty millions of acres of swamp are located, and estimates that if properly drained they would furnish homes for six millions of people and crops worth $750,000,000. Of much interest, also, are the impressions of W. E. Curtis, gained during a recent visit to Russia, of the manner in which the autocracy is being overthrown. He has little praise for any of the actors in the great drama with the exception of Premier Stolypin, who in three months introduced "more reforms than were ever known in any previous administration." Attempts to prevent the dissemination of revolutionary literature have practically ceased. In St. Petersburg "you can buy revolutionary music, photographs, and post cards on the streets, and at the news-stands. . . . One of the most popular and profitable photographs represents William Jennings Bryan sitting in the centre of a group of the reddest socialists and anarchists in Russia. It was taken on the steps of the Tauride Palace during a session of the Duma, and has done incalculable harm, because it has convinced many honest workmen that Mr. Bryan and the people of the United States sympathize with the bomb-throwers and anarchists."

In "Seeing and Hearing" (E. P. Dutton & Co.), Mr. George W. E. Russell has produced another volume of mixed gossip and reminiscence, after the general fashion of his "Collections and Recollections." This new book differs from the old in not containing so many anecdotes, and in being a trifle more reflective, even pensive at times, but the note is much the same; the good-natured observer looks out upon the life which passes before him and allows it to stir his memory and provoke him to literary allusion and a sort of sub-acid Horatian comment. Mr. Russell knows English society intimately, and this volume is a sort of chorus accompanying it throughout its "season" and on its travels. There are five chapters on the pleasures, or pangs, of the table; others on social changes, purple and fine linen, suburban Sundays, hospitality, ostentation, publicity versus reticence, etc. We have said enough to show upon what kind of topics the author comes forward again in his guise of agreeable rattle.

An interesting attempt to apply some of the results of experimental psychology to the art of public address is made by Prof. Walter Dill Scott of Northwestern University in "The Psychology of Public Speaking" (Philadelphia: Pearson Brothers). The author has written for those unfamiliar with the methods and results of the newer psychology, and with the purpose of offering helpful suggestions to all classes of public speakers. Some of the investigations of eminent psychologists are described, together with experiments which have become common in psychological laboratories; and the principles thus established concerning the reproduction of mental images, the expression of the emotions, the fluctuation of the attention, and kindred subjects, are applied to the art of oratory. It speaks well for the author that the counsels regarding public speaking which he derives from psychology are very similar to those which successful speakers have reached by simpler methods, but the advantages of his more technical approach to the question are obvious. There are doubtless few public speakers who would not receive helpful suggestions from Professor Scott's study.

Those who care to hear something in its favor will find in "Alcohol, the Sanction of its Use," by Dr. J. Starke (G. P. Putnam's Sons), an ingenious if not altogether convincing discussion. The author's main contention is that a sharp distinction must be made between moderate drinking, for the sake of stimulation, and drunkenness where oblivion is sought. He considers alcohol to be nutritive, although not an economical food, and contends that its judicious use is valuable in abating nervous irritability and regulating the distribution of the blood as well as for other purposes, ends that may be attained without increase of quantity or the development of any pathological condition or any form of "poisoning." Drunkards are persons who are abnormal, or otherwise unfortunate, and who feel the need of some sort of stupefaction; in certain cases other substances (*e. g.*, fusel oil, absinthe) are the real cause of the trouble and not alcohol. The translation, from a German original, is for the most part smooth and clear, but the "checking sensations" of the sixth chapter are somewhat obscure.

Prof. Adolf Harnack's classical work, "Die Mission und Ausbreitung des Christentums in den ersten drei Jahrunderten," which appeared only three years ago in one volume of 572 pages, has now appeared in a second edition of two volumes, with a total of 747 pages. This work, which the Berlin savant himself declares to be his "favorite" production, has proved to be a pathfinder in analyzing the inner factors and forces that enabled Christianity to become the leading religion of the world. Among the new additions in the second edition is a group of twelve maps and charts prepared by the author himself.

F. Loraine Petre, who has long made a special study of Napoleon's military operations in northeastern Europe, now publishes "Napoleon's Conquest of Prussia" (John Lane). The battle of Iena and the subsequent operations up to the Emperor's occupation of Berlin and Murat's capture of Lubeck form the central thesis of the book. The author reproduces with considerable care, and with due accompaniment of maps and illustrations, the information gathered by the best French and German authorities on the subject; and if he has nothing very novel to offer, he is generally safe to follow. The designation of such a well-known military writer as Hohenlohe Ingelfingen as "Prince Kraft," will, however, puzzle most readers.

John Mackintosh, LL.D., has died at Aberdeen in his seventy-fourth year. Dr. Mackintosh was almost entirely self-educated, having been sucessively farm-hand, shoemaker, policeman, and stationer. He found time to write a "History of Civilization in Scotland," in four volumes, another volume on Scotland in the Stories of the Nations series, as well as various monographs.

From France comes the news of the death of Eugène Le Roy at Montignac, his home and the scene of his romances. From Berlin the death is announced of the novelist Robert Schweichel, author of "Der Bildschnitzer von Achensee," "Heimatlos," and other stories. And Italy has lost the poet Luigi Conforti, who died at Naples in his forty-third year. The best known of his books of verse is "Pompèi" (1886).

A NEW STUDY OF CRABBE.

Un Poète réaliste anglais, George Crabbe, 1754-1832. Par René Huchon. Paris: Hachette et Cie.

George Crabbe and his Times. A critical and biographical study. By René Huchon. Translated from the French by Frederick Clarke. New York: E. P. Dutton & Co. $5 net.

René Huchon, of the University of Nancy, exemplifies in this definitive treatise the conscientiousness of French scholars in the discussion of English literature. The chief authority dealing with Crabbe's life is the often reprinted biographical study by his son, which was freely used by Canon Ainger and T. E. Kebbel in their popular sketches for two well-known series. The work now before us fulfils the most exacting demands of higher academic research by rectifying misstatements in all three lives, and in its exhaustive sifting of a vast number of minor sources heretofore unstudied. How wide a range these involve may be seen at a glance from the admirable appendices and bibliography, as well as from the countless corroborative footnotes. And, further, incidents in Crabbe's life are again and again illustrated with the help of quotations from the poems, which thus carry out the biographer's purpose of interpreting characters and conduct through the detailed study of accomplished work. Any competent reader of "The Patron" ("Tales," V.) divines, without promping, the autobiographical bearing of its situation; but the ingenuity of M. Huchon transfers the same method of reading to "The Widow's Tale" ("Tales," VII.), wherein few students would have suspected a more than probable allusion to the poet's wife and her queasy feelings in the following verses:

> The air surcharged with moisture flagg'd around,
> And the offended damsel sigh'd and frown'd;
> The swelling fat in lumps conglomerate laid,
> And fancy's sickness seized the loathing maid, etc.

At the end of Part IV. of his book M. Huchon supplies a significant list of analogous identifications in support of his contention that Crabbe's "realism" draws its

vitality from immediate surroundings. Indeed, the very order of appearance of "The Village" (1783), "The Borough" (1810), and "Tales of the Hall" (1819) may be held to indicate his readiness to utilize his steadily extending social knowledge in the leisurely presentation of rural and provincial life.

Herein, as M. Huchon shows, lies Crabbe's affinity with the later realists and naturalists of the nineteenth century, whose methods and results he in a measure anticipated without exercising any strong influence on them, even through suggestion. He shares, moreover, their dominant conviction of the inexorable pressure of existence, their sense of disillusion, their unflagging interest in the study of degeneracy with all its grimy consequences; and, as adviser bodily or ghostly, he had perhaps obtained an occasional closer view of moral plague-spots than the searcher after "documentation." But the parallel, it should be added, stops here. In another aspect, the work of Crabbe might prove to be more closely related to the work of Gissing and Hardy, concentrated, as each in turn chiefly is, upon one region of the national soil. Where Crabbe differs emphatically from all of them is in the clerical didacticism imposed on him by his profession and the literary practice of eighteenth-century England. It may surely be guessed that consciousness of these limiting conditions produced in Crabbe the reticence over some forms of detail, which (as appears from App. iii.) his public would have disrelished, in spite of the precedent established by Fielding. A country parson had best be chary of reiterating that

> . . . Joseph's fame had lessened in our view
> Had he, refusing, fled the maiden, too.
> —["The Borough," III.

We are disposed to think that most of Crabbe's critics lay inadequate stress on his quiet sense of humor, sparingly drawn upon (we admit), and yet enlivening many a *longueur*. To this theme M. Huchon gives a division of pt. iv., ch. 1, which analyzes two designedly comic tales. But in "Lady Barbara; or, The Ghost" ("Tales of the Hall," XVI.), a solemn warning against ill-assorted unions unexpectedly tells us in whimsical phrase,

> How ghosts advise, and widows persevere.

"Inebriety" (1775) shows clearly this early bent in the poet who describes the tavern sot in the lines (disrespectfully parodying Pope):

> Whose head proud fancy never taught to steer
> Beyond the muddy ecstasies of beer;

which culmination achieved, the fuddled swain

> . . . shapes his way in ill-proportioned curves.

In similar vein, we hear that the thrifty man

> . . . sometimes saved his cash
> By interlined days of frugal hash.

One might safely conjecture that had Crabbe been subjected to a shorter and less acute period of *vache enragée*, his pages might have been more frequently spangled with such gladdening phrases, turned with the neo-classic precision of his time. And it is the same gift of easy verbal fitness which points his satirical compassion in such verses as

> The piteous patchwork of the needy vain.
> —["The Borough," XV.

As M. Huchon points out in his conclusion, the origin of such a style is obvious.

What might perhaps have claimed more emphatic notice is the responsiveness of Crabbe's thought to the influence, not only of the great revolutionary humanitarianism, but on distinct occasions to less conspicuous impulses, philosophical or literary, of the transition period which coincided with his maturity. So late as "The Dean's Lady" ("Posth. Tales," XIII.) we find an introduction to a mild satire on "blues," which nevertheless conveys in a few short lines the very spirit of Mary Wollstonecraft's "Vindication of the Rights of Woman" (1792), in its advocacy of advanced education for the capable of the sex. In the case of "Sir Eustace Grey," published in 1807, M. Huchon recognizes in a footnote the influence of a phase of romanticism directing Crabbe to the choice of progressive madness as a theme for a poem whose vivid and swinging lyrical verses offer a most striking contrast to the usual humdrum beat of his heroic couplet. This quality Canon Ainger ascribed to the suggestions of an opium-dream. We remember that M. G. Lewis's "The Captive: A Monodrama" had (1803) terrified an audience with the frenzied cries of a madwoman. The seeker after parallels might follow up the literary trail to a melodramatic page in "Pickwick."

This admirably arranged monograph of M. Huchon's is, however, mainly concerned with life and character. Its abundance of literary judgments is presented rather in dispersion than compactness, for the purpose of elucidating the biographical theses; and the complete proportion and harmony preserved throughout may well be considered the crowning achievement of the work. At the recent unveiling of the memorial to Crabbe, in his native town of Aldeburgh, M. Huchon filled the place which, even then, belonged to him as of right; he has now completed his independent monument—the worthier of the two.

TURKISH LAW.

Corps de droit ottoman. Par George Young, M. V. O., 2me secrétaire de l'ambassade d'Angleterre. Vols. IV.-VII. New York: Henry Frowde. $5 each.

In noticing the first three volumes of this monumental work (*Nation*, January 25, 1906), an account was given of those peculiarities of Turkish law, as to origin and form, which make a statement of it so complicated and abstruse. Behind this Corpus, as behind the legal system of every Muslim state, lie, when historically developed, at least five elements. First, there is the sacred law, what is meant when the Muslim law is roughly and ignorantly said to be based upon the Koran, corresponding in a sense to the canon law of the Roman Church; this system originally affected all the sides of life, but is now limited, in almost every Muslim state, to some phases only. Second, modifying and displacing the above, come the local usages of the different Muslim peoples and countries; these have often completely obscured and annulled the requirements of the canon law. Third may be reckoned specific statute law imposed by the will of rulers. At first showing itself in the form of individual decisions of the ruler, judging his people in the gate as was his right and duty, this element has expanded into the elaborate system of Turkish statute law, based on the French and other European codes. Fourth are the laws and usages of the different non-Muslim communities living under Muslim rule. Towards these Islam has always maintained a contemptuously tolerant attitude, leaving them to administer themselves under their own ecclesiastical organizations. Fifth comes what is strictly an extension of the above, though now developed into its basis and support, the extra-territorial law of the capitulations and conventions. European merchants, etc., living and trading in Muslim lands, were put, at first by usage and finally by treaty, under the justice and control of their own consuls. So an element has developed which makes it impossible for a Muslim state to modify its legal system in any way that can even remotely affect non-Muslims, without the consent and adherence of the European embassies. But, finally, if these elements are stated as they stand at present built into the one complicated structure of Ottoman law, it may be said that they are three-fold: the religious law of Islam; the civil law, consisting of the statutory law of the Ottoman empire, and the customary law of the races composing it, Muslim and non-Muslim; the international law of capitulations and conventions, with a contractual sanction of its own.

In the present four volumes, then, all these elements are more or less evident. Although the law of the capitulations is not expressly treated, yet one side of its practical working comes out strikingly, namely, that which makes the European embassies at Constantinople a kind of Supreme Court, passing upon Turkish legislation. Again and again there come in the annotations such phrases as "communiqué aux Missions," "les Missions n'ont jamais accepté," "ce Code, communiqué aux Ambassades, a été soumis a une Commission de drogmans," "les Missions n'ayant jamais accepté ce code de Procédure civile, considèrent comme encore en vigueur. . . ." This is not only in defence of Europeans resident or trading in Turkey, but also of the native non-Muslim Turkish subjects. For example, one of the devices used to raise money for the Hijaz railroad has been a tax levied by means of stamps on a variety of decrees, documents, etc. This has not been accepted by the embassies, because it is made applicable to all Turkish subjects, non-Muslims as well as Muslims, while the railroad itself is essentially connected with the religion of Islam, being intended to afford easy communication with the two holy cities, Mecca and Medina (vol. v., 282).

Another example of similar control of an essentially Turkish matter is the foreign mail systems. The history of these is given in vol. iv., pp. 388 ff. They began with the mail-bags carried by couriers from the different embassies in Constantinople, Foreign Office messengers, in the English phrase; and developed with the tacit, and in the case of Russia and Austria, explicit agreement of the Porte into a number of completely organized postal systems. At first the Turkish Government troubled itself with none of these things, and even entered into treaty relationships

which are now interpreted as a permanent derogation of its sovereign rights with regard to postal service in its own dominions. Only in 1874 was a formal but unheeded protest made to the Postal Congress at Berne. In 1888, when Constantinople was connected with the European railway net, a further attempt was made to do away with the foreign post-offices. The railway was directed to refuse to carry their mail bags. But this movement also failed, and since then the Porte seems to have contented itself with a series of fruitless and simply irritating "incidents," never carried through. Thus in 1895 the English, French and German agents were arrested, and in May, 1901, on the arrival of a train, the police carried off by force all the mail bags to the Turkish post-office, doing the same with those brought to the station to be sent away. The embassies then sent the mail bags under escort, and the Porte collapsed.

The situation, of course, would be impossible in any but an Oriental state or a comic opera. But Turkey, theoretically and practically, is out of court on three counts. First, her late awakening to her rights as a sovereign state; secondly, her weakness—she is not strong enough to take back the rights which she indolently and carelessly abandoned; thirdly, her incompetence—it is notorious that she could not adequately administer this trust if it were restored to her. As to legal right, as to force to take and hold, as to moral right, Turkey is equally impotent.

The element of specific statute law imposed by the will of the ruler is naturally most of all represented in these volumes. For it the French codes have been most frequently consulted. Thus the penal code of 1858 and 1863 (vii., pp. 1 ff.) goes back, with important divergences to that of France; the commercial code of 1880 (vii., 58 ff.) is a simple extract from the same with omissions; the maritime code of 1863 (vi., 103 ff.) similarly with extracts from the Dutch, Spanish, Italian and Prussian codes. Of a more mixed origin is the civil code of 1869 ff., commonly called the *Mejelle* (vi., 169 ff.). It professes to be based on the views of the Hanafite school of canon law; but is largely influenced throughout by the "Code Napoléon." It may, therefore, be classified as statute and not sacred law. But though the canon law is not expressly treated in these volumes, its influence here and elsewhere cannot be mistaken. The unchangeable Islam lies behind all the codes, and is the burden which all Muslim states have to carry. If we may compare a great effect with a small, it might be likened in its workings to the supposed Mosaic prohibition of marriage with a deceased wife's sister and its echo in English law.

To give any complete statement of the contents and varied interest of these volumes is naturally impossible. Naturally, also, they are not easy reading. But he who cares to get back to the roots and reasons of things, to see them as they are and work, and not as the polite historian dresses them up, will not mind his time spent over these paragraphs and tables. In volume iv. he will see the Ministry and Chamber of Commerce constituted and the chambers of commerce of the different nationalities at work. Almost two hundred pages are given to a very frank and precisely documented and figured history of the Turkish railways, each being treated in turn. We have not theories and hopes here; but the facts as they exist up till now. Roads, posts, telegraph, weights and measures follow. Under the last there is something even for the philologist in an elaborate table of the weights and measures of the empire. "Anciens" they are called here, though the Turk has been wrestling unhappily since 1869 with the metric system, and it has not yet downed his picturesque confusedness. Volume v. contains the financial and fiscal law. The system is bimetallic. But 15 to 1 is not precise enough for an Oriental; 15.0909 to 1 looks much better on paper. Behind that equation, of course, are endless ramifications of value; there are not only piastres gold and piastres silver, but these have different values for different accountings and different localities. An elaborate budget is worked out with the interesting result (p. 18) of an annual deficit of two million pounds Turkish. To that the remark is added:

> L'équilibre a été maintenu dernièrement par des économies dans les traitements des employés [*i. e.*, non-payment of salaries], par l'introduction de quelques nouveaux impôts et par diverses ressources financières telles que conversions et unifications.

There follow the history and constitution of the Imperial Ottoman Bank, the history and situation of the Public Debt, and a statement of the different forms and sources of revenue. In these the salt monopoly plays an important part, involving constitutional questions with the Principality of Samos (p. 145), that survival as singular as the House of Keys in the Isle of Man, and with the British protectorate in Cyprus. It is curious to find a constitutionally teetotal Muslim government drawing revenues from wines and spirits and applying the principle *non olet* like any prohibition State. It has also "hundred yard regulations," here from mosque, school, dervish cloister, and cemetery, and a requirement that there shall be no back doors (p. 160). A very different regulation, going back to the earliest times of Islam and fixed in the canon law, is the head-tax (*jizya*) on non-Muslim subjects; at first a payment for protection, now regarded as in lieu of military service. Under that heading it is now entered (p. 275). The tithe has undergone a similar development. At first imposed by the canon law upon Muslims, there was later incorporated with it the very different land-tax, payable by non-Muslims under the constitution of Umar; and both have now developed into a confused system of general land taxation. In volume vi. we are given the law of forests, mines, and land titles, the nearest approach made to a cadestral survey in a rough kind of Doomsday Book (p. 90); pious foundations in mortmain (*waqf*), like mediæval European monastic endowments, which have so developed as to comprehend more than three-quarters of all lands built upon or cultivated (p. 113); the municipal law of Constantinople, and the civil code mentioned above. The contents of volume vii. have also practically been noted above, except as regards an index of almost forty pages.

With what judgment, skill, and industry Mr. Young has done his work of compiling, editing, and annotating, there can be no shadow of question. In spite of the delicacy of his situation as member of an embassy at Constantinople, he has succeeded, through tact and courage, in meeting the facts in the case. To him who understands there is many an innocent little foot-note, here and there, which will tell much. The actual situation in Turkey, it need not be said, is to be discovered from these, rather than from the beautiful phrases of the codes. Finally, no library of any size, certainly no law library, can afford to be without a copy of this thesaurus.

CURRENT FICTION.

The Cruise of the Shining Light. By Norman Duncan. New York: Harper & Bros.

To suggest that Mr. Duncan's new story contains something both of Mr. Jacobs and Mr. Phillpotts implies not a charge of plagiarism, but a tribute to the unusual quality of his book. There is a queer seafaring, or rather water-side, humor in the old derelict Nicholas Top, who brings up his adopted nephew by the joint light of the Psalms of David and a battered copy of Lord Chesterfield. However fanciful this may be, and remote from probability, it is at least successful in keeping to the color and texture of the wholly artificial medium which Mr. Duncan has chosen to employ. The medium itself has much of Mr. Phillpotts's peculiar intensity, although the dialect of Newfoundland naturally differs from the obscure tongue spoken by English hinds. The theme also has that curious moral twist we are apt to associate with Mr. Phillpotts's saturnine tales. In this instance it is a case of high-minded blackmail, undertaken from the purest and least interested motives and carried through with success, both in accomplishing Nicholas Top's aim and in mystifying the reader—blackmail, nevertheless, entirely ruthless and without the law!

The whole story has a distinct atmosphere of its own, lurid, oppressive, darkened by storms, by sinister episodes on land and sea. The episodes, in fact, at times threaten to overweight the main theme; such a chapter as the parson's struggle for Elizabeth's soul, though full of genuine power, seems almost too tragic to form part of what is, after all, a slightly fantastic genre picture. Nevertheless, the whole leaves a distinct sense of force and individuality, if not of photographic truth. Perhaps upon another retina, the life at Twist Tickle might make a less harsh impression of a community rife with unwedded mothers, unfathered children. But whatever the literal fact, no one can doubt that Mr. Duncan reflects the shadow cast by facts upon his own special individuality. Hence "The Cruise of the Shining Light" may lay definite claim to be considered as a real book, that indefinable result of original personal impulse and conservative literary tradition.

Ghetto Comedies. By Israel Zangwill. New York: The Macmillan Co.

In his latest work, Mr. Zangwill has succeeded in the difficult feat of preserving a twofold interest. Each story stands complete in itself, may be read by itself purely as a new example of his witty observation, as an amusing bit of character sketch-

ing without reference to the reader's attitude towards the Jewish question. Taken as a whole, however, each story will prove to form part of a wonderful piece of affectionate satire and speculation upon the attitude of the Jewish world towards its own contemporary problems. This effect is cumulative, reaching its climax in the tragic picture of a Russian village full of Jewish philosophers bent on solving the difficulties of Russia and the world by theory alone. They dispute blindly over Marx, Hegel, Spencer, Zionism, Territorialism, Bundism, parties by the dozen, panaceas by the score, until "the unconditional historic necessity had overtaken them all" in the form of Russian Gatling guns.

Most of the stories take place in England, and two at least are as robustly and delightfully humorous as "The King of the Schnorrers," but in the majority the comedy is of the saturnine kind, and plays about the contest between Jewish national feeling and genuine patriotism to adopted king and country. "Anglicization" deals with an acute phase of this struggle. S. Cohn, rich shopkeeper, a jingo of jingoes, grows hot over the dismemberment of "our Empire." He contributes largely, gives a bonus to clerks volunteering for service in South Africa; he is pure English to the core until his only son also puts on the khaki. In a few short conversations Mr. Zangwill typifies the whole situation—the clash between generation and generation, the conflict between heredity and environment. "The Sabbath Question in Sudminster" gives a witty application of Talmudic casuistry to practical business, and "The Luftmensch" contains brilliant pages of peculiarly Jewish humor, never ceasing to be amusing, but always illuminating some characteristic national trait.

In reading these stories (fourteen in all) it is impossible not to feel that merely as a writer of fiction, Mr. Zangwill has gained greatly in the past decade. Moreover, his point of view has broadened, and while his sympathies and enthusiasms are as distinctively national as ever, while he still loves so tenderly that he can find fault, or even laugh, he never falls into that partisan sentimentalism which would rob his Jewish pictures of their unflinching sincerity.

The Windfall. By Charles Egbert Craddock. New York: Duffield & Co.

Really, Miss Murfree should do better, if only for the sake of her early admirers. Fancy recommending her as one of our delightful writers, say, to an intelligent Frenchman, and having him then chance upon "The Windfall"! But listen:

A wandering showman (who speaks a Tennessee version of Bowery) pitches his tents in a village of the Great Smoky. Strolling up the road he falls in with some moonshiners (of whose trade he forms no suspicion, although the reader is fully aware of it before ten words are uttered). He admires Clotildy, the daughter of the tribe, in a purely professional way, and engages her to do a turn of native song and dance at his show. The moonshiners seize this as an excuse to come to town and drive a thriving business, under cover of seeing the entertainment. Clotildy's lover, a desperado wanted for "time," is jealous of Lloyd, the showman. Clotildy falls in love with Lloyd. Her natural grace and talent fail to please the rustic audience, but charm an aristocratic party who are storm-stayed in Persimmon Cove. One of the aristocratic ladies falls in love with Lloyd, who unites the "form" of Cashell Byron, the features of Antinous, with the sterling worth of Abraham Lincoln and Aristides the Just. Clotildy's lover attempts Lloyd's life. The aristocratic lady's lover denounces him as a criminal accomplice of the moonshiners, mistaking a mysterious stranger who joins the party for a revenue officer. The stranger turns out to be a respectable lawyer ranging through the mountains in search of a missing heir. Lloyd naturally proves to be the inheritor of millions, and an aristocratic name, and so on! By the way, the lady, of course, loses her heart to Lloyd long before the lawyer establishes his eligibility.

Alas! the treatment is altogether worthy of the conception. The scourge of many words and long, long words, has fallen upon this formerly estimable writer. She shows no trace of self-criticism or self-restraint. She talks of "repetitious echoes"! She does not hesitate to say that "Mrs. Laniston had a monition of George Laniston's ultra particularity," and gives herself free rein in page upon page of the very dullest description that ever escaped editorial scissors.

The Censorship of the Church of Rome and Its Influence upon the Production and Distribution of Literature. By George Haven Putnam. 2 vols. New York: G. P. Putnam's Sons. $5 net.

For some 2,000 years the constant effort of the government of Rome has been to control public opinion. During the Imperial period bread, the circus, and the Pretorian guard fulfilled this object. During the mediæval period religion, its monopoly of intellect, its centralization at Rome, and a surviving sense of European unity continued the older tradition, though on a less specifically political basis. From the Renaissance to our own day, following the enormous expansion of Europe in numbers, in knowledge, and in thought, Rome has continued the struggle against diversity and disruption by erecting a dam of prohibition and punishment against new ideas. For from that period, and even more markedly since the seizure of Rome by Victor Emmanuel, the authority of the Pope stands only by the constant guarding of an ancient tradition.

The long series of the Indexes of the Church, which catalogues the ideas it prohibits, begins at the time of the Reformation and constitutes, with such kindred documents as the bull *Quanta Cura*, the official record of its struggle against modern thought. The printing press was clearly the vehicle that was to carry European intellect to vast realms hitherto untouched, and Rome must control the printing press or see her loved traditions rudely assailed, perhaps overturned. Dr. Putnam classifies the pilloried works under a number of heads; but what is perhaps even more important than to arrange a more or less arbitrary system of classification, is to note that the Index system shows on its own internal evidence its inability to withstand the tide it is set to dam. Contrast, for example, the books prohibited in past centuries, and those tolerated now. "Robinson Crusoe" was indexed as subversive, but "News from Nowhere" or the wildest flights of Mr. Wel's are apparently not worth bothering about. Copernicus, who held that the earth moves round the sun was duly indexed, but Professor Pickering, with his arguments for the existence of life on Mars, is in little apparent danger. In other words, though certain books which for one reason or another attract wide notice, as those of Loisy or Fogazzaro, will continue to be pilloried for some time to come, yet the fact is fairly clear that the tide of printed knowledge and opinion is now far too great and far too active for the artificial barrier of Indexes which Rome still attempts to set up.

In dealing with this large and difficult subject, Dr. Putnam appears to have fallen between two stools. He might have given us a complete record of the Roman censorship, with bibliographical apparatus—he might, in other words, have addressed himself exclusively to scholars and furnished them with a definitive work of reference on similar lines to Reusch's "Index der verbotenen Bücher." Or, again, he might have turned to the philosophy of the subject, treating its history on broader lines; for where could a more important and more difficult thesis be found than in the struggle of Roman Authority against freedom of thought? He has not exactly done either. Although the book shows evidence of considerable labor and contains much matter not to be found elsewhere in convenient form, it is frankly selective, and therefore not of essential value for scholars. On the philosophical side, again, Dr. Putnam has but little to offer, though it must be added that there are few living historians one can imagine rising to the height that such a task demands. The book is somewhat loose in style and inaccurate in minor details.

Cavalry in Future Wars. By Lieut.-Gen. Frederick von Bernhardi, Commander of the Seventh Division of the German Army; translated by Charles Sydney Goldman; with an introduction by Lieut.-Gen. Sir John French. New York: E. P. Dutton & Co. $3 net.

Gen. von Bernhardi undertakes briefly to review the whole subject of modern cavalry, with a special application to the service of his own country. His rank and experience entitle his views to great respect, the more from the earnestness with which he pleads his cause. Not a partisan of the old school, he lends a partial support to the new ideas; yet he contemplates the possibility of such feats as the attack, mounted, of infantry and of artillery, an operation regarded by the new school as all but absolutely impossible. When we write *new* and *old*, we have only European conditions in mind, for here in America the problem of the proper use of cavalry was long ago solved once and for all, a point which we shall discuss later.

No reader of the foreign military press can fail to be struck by two facts: the prominence given to the subject of cavalry combat, and the unconsciously apologetic attitude of most advocates of the so-called new theories. The whole question is this. Has cavalry as such disappeared from the

modern battlefield? If not, we must arm and train our horsemen to charge on the hostile ranks. But if it has disappeared, that is, if the charge is no longer normally possible, we must break with the past, we must arm and train for the new work. Most European cavalries are suffering today from the traditions of their glorious but dead past. They are dying hard, sword in hand, unwilling or unable to see the dawn of a resurrection in an adaptation of cavalry to modern conditions of warfare. And so two camps are formed, according as shock or fire is the mode of action advocated; the middle ground between these extremes is occupied by those who, like Gen. Bernhardi, see a future combiuation of the two.

It is easy to sympathize with the defenders of the old cavalry. Heirs of that elder day when to ride down the close-formed enemy meant victory, of the traditions of Von Seydlitz, of Murat and Lasalle—why, they ask, should an arm so decisive in the past have lost any of its importance today? What a fine thing it was, in the very nick of time (the "psychological moment" of the text-books), to launch our squadrons on the opposing lines, and taking them all, horse, foot, and gunners, in the stride as it were, by one stroke to do the whole business! Shall no future Kellerman again turn defeat into victory by one charge home? Shall we never again hear "Scotland forever!" on some future Waterloo?

The reply is no, and it comes mercilessly from the magazine rifle and the rapid-fire field gun. But long before smokeless powder the answer was negative. For this problem is no new one to us: it was settled years ago by Stuart and Sheridan and Forrest. All the corollaries were established; once the mode of action was fixed, the questions of equipment, of armament, of leadership—all these passed at once into the category of undisputed and accepted results.

Did our solution exclude shock action, the cavalry combat pure and undefiled? By no means; the troopers on each side charged with the sabre wherever circumstances called for it, as freely as they dismounted to fight on foot, whenever mounted work seemed unprofitable or out of the question. We discovered a great principle: that cavalry is a means, not an end. And it is to this principle that the adherents of the old school are blind to-day. They are riding for a fall. So sure have we always been of the soundness of our solution of the cavalry problem, that one of our foremost military writers, the late Col. Arthur L. Wagner, predicted years ago its acceptance by all foreign services. The failure of the Russians to accept our conclusions, according to Gen. de Négrier, lost them the battle of Mukden. Hear further what that admirable officer remarks in the *Revue des Deux Mondes:*

> The complete reorganization of our [French] cavalry has become a necessity. . . . What we agree in calling cavalry spirit, *l'esprit cavalier*, is opposed to fighting on foot, *the essential thing* [italics ours].

So Lord Roberts—we have not his exact words: "The sabre must hereafter be secondary and the rifle the main thing: the trooper must become an excellent shot, and must learn how to fight on foot." And again Gen. von Bernhardi, in the book under notice (p. 49):

> Whereas formerly the *arme blanche* was recognized as the principal method by which the cavalry made its inherent fighting power felt, the employment of dismounted action nowadays has gained in importance to such an extent that the whole character of our activity appears completely changed.

Of a truth Col. Wagner's prophecy is approaching fulfilment. It is only a question of time when the troublesome lance and absurd cuirass will have been rejected, when the hurtful distinctions between light and heavy cavalry will have been abandoned in favor of the type developed and fixed in our own land.

A close reading of Gen. von Bernhardi's book reveals the fact, in regard to the main question, that he is unwittingly carrying water on both shoulders. Compare the passage just quoted with the following (p. 62):

> Having admitted that dismounted action has increased considerably in importance, particularly on the offensive, it nevertheless remains the fact that the combat with the cold steel remains the chief *raison d'être* of the cavalry, and when the principles have to be considered according to which troops have to be employed upon the battlefield, the actual collision of cavalry "masses" remains the predominant factor.

This view we can accept only under the assumption that both sides by common consent withdraw their horsemen from the battlefield, and by tacit consent agree to a decision by shock. The thing may happen, but surely not as a normal case. As to the German cavalry, the author's suggestions for improvement are in the main sound. His tactical recommendations, however, inevitably reproduce the defect of all the other texts with which we are acquainted—extreme generality. The fact is, it is far harder to lay down rules for cavalry than it is for infantry or artillery.

Barring a few slightly obscure passages, and a faint trace here and there of Teutonic roughness, Mr. Goldman's translation is smooth and flowing. The one or two short passages quoted from the original are badly mispriuted. The expression "hang of the ground" (p. 65) for the "lay of the land," is new to us. There is a good index, and an introduction by Sir John French, in which that officer unequivocally ranges himself on the side of the author.

Success in Life. By Emil Reich. New York: Duffield & Co. $1.50 net.

A book with this title is pretty certain to have no practical value. Life is not a foreign country to which, before setting out to travel through it, one buys a Baedeker's Guide. It is one's native place, and who ever thinks of consulting a guide in order to find one's way about there? In an idle hour one may possibly glance through some tourist's handbook to it, to divert one's self with the mistakes contained therein, and with its odd alien view of the familiar. To one looking backward such a book may have a certain dilettante interest, but to one looking forward it is an impertinent superfluity. As a guide to success in life, Dr. Emil Reich's set of essays is no exception to this rule. "In considering the lines of success we take it for granted that the initial mistake of selecting the wrong line has been avoided." This huge assumption might be called vicious, if it were not inevitable. Later on Dr. Reich discusses "the methods helping us to avoid the initial mistakes." But he had better have left them undiscussed. The attempt only displays the folly of the whole undertaking.

The book, however, has an interest and value not promised in its title. A large part of it is an examination by a cosmopolitan foreigner of the peculiarities of the British boy. Dr. Reich has taught the British boy and knows a good deal about him. He also knows a good deal about the United States and France and Germany. He is therefore able to compare the young Briton with his compeers elsewhere, and the comparison is often ingenious and instructive. He writes cleverly, for instance, about British "tongue-tiedness," which, as he says with some truth, "the young Englishman ascribes to some mysterious 'racial' quality of a nation 'born to rule.'" He points out the many drawbacks of the habit, and establishes a connection between it and the frequency and expensiveness of litigation in Great Britain:

> From the inveterate habit of refraining from talk and verbal discussion, the average Englishman rather than settle a difficulty by means of an animated talk, will at once have recourse to a solicitor. The truth is that Englishmen, averse to talking, prefer to hire a man who will talk for them vicariously.

There are a good many acute remarks in the chapters on "Woman," "The Journalist," "The Novelist," "The Dramatist," "Lawyers and Doctors," "The Statesman," each of which headings should be preceded by the epithet "British." For the whole book is written with reference to British conditions. As a criticism of these it is interesting. Dr. Reich is a Teutonic Max O'Rell, who has read Schopenhauer and Herbert Spencer.

Science.

LINNÆUS.

This week the two-hundredth anniversary of the birth of Linnæus is celebrated by the scientific world with a gratitude due to an appreciation of the important reforms he introduced. It is universally recognized that his improved methods of description, characterized as they are by simplicity and directness, emancipated the study of natural history from embarrassing complexities. He possessed a marvellous power for detecting resemblances and differences, and for giving expression to them in a few well-chosen terms. This power was united to untiring industry, and resulted in contributions of such importance and extent that they constitute an epoch in biology. The two biological sciences divide their history into pre-Linnæan and post-Linnæan time, and this division is recognized widely for its convenience even by those botanists and zoölogists who do not accept its strict validity. By his diverse activities in every department of natural history he attracted to its study innumerable enthusiasts, who, by the use of his methods, enriched mineralogy and geology, as well as zoölogy and botany. Much of the material thus brought

together has been redistributed and redescribed, and hence many young students to-day are unaware of the relation which their Linnæan predecessors bore to it; to some of the youngest students, it may be a surprise to learn that Linnæus, before he had reached the age of twenty-five, had introduced reforms in all of these sciences. The three things which are most prominent in the thoughts of naturalists to-day, as they commemorate Linnæus, are, first, his substitution of precision and conciseness in scientific language for vagueness and prolixity; second, his astounding sagacity in discriminating between small groups of natural objects (genera and species), and third, his stimulating influence upon his age.

Linnæus was fortunate in his birth, training, and opportunities. His home was an ideal birthplace for a lover of nature who was to serve and suffer as a reformer. His earliest associations were with the fields and forests of Smaland, in Sweden, where every thicket had its legend and every water its guardian fairy. The father wished that his son should follow in his steps as pastor, and sought to educate him to that end. But Linnæus had no taste for such a calling. After a dozen years had been passed in a desultory study of nature, with hardly any acquirement of book knowledge, it became necessary to give up the idea of making him a pastor, and steps were taken to choose a handicraft. Here good fortune intervened, in the guise of a country doctor, who begged that the lad might put off his apprenticeship to the cobbler's or the tailor's trade at least a year. The year was granted. It was delightfully passed in collecting and studying plants and animals, and then the youth was induced to begin an academic career at the University of Luud. After a short stay at this institution, he made his way to the more northern University of Upsala, and there found within his reach even more abundant material for his untiring study. But he was the very poorest of the poor. Only the scantiest means could come to him from the home which was so disappointed in his course, and he had now long and painful struggles of the most trying sort. In the university town, which this year celebrates with splendor the achievements of the scholar who has made it most famous, the lad was reduced to mortifying expedients for food and clothes. Hard work gives exceptional training. Certainly it was in large part this training, and not that which he received from his teachers, which made him what he was. His instructors were accomplished and active, and they were anxious to do all they could for all their pupils. But this lad was so impatient of restraint and criticism, and delighted so much in criticising the errors of his teachers, that only strained relations could exist between them. But, in spite of his peculiar temperament, all his teachers recognized his ability, and frequently assigned him tasks out of the common way. For instance, he had the responsible work of rearranging certain collections of living plants in the gardens, and during this period he was indefatigable in investigations in his own way. Thus he was able to accumulate voluminous notes, which he was soon to use in his own treatises. But since he made no concessions to the reasonable prejudices of his teachers, he received little formal instruction, and at times was scarcely on speaking terms with them. It is therefore no surprise to learn that, following a common Swedish custom, he decided to ask for his doctor's degree in a foreign country. The degree was secured in the now vanished University of Hardewyk, in Holland.

With this degree of Doctor of Medicine in hand, he began a long course of study in Holland, France, and England For the moment we may restore the old term of journeymau, and speak of these next four years as a fitting supplement to what had been a very irregular apprenticeship in Sweden. His travels were confined to the localities where there were important botanical gardens or collections of dried plants. In almost every place he received warm welcome, and it does not appear that he often wore his welcome out or even threadbare. He was always outspoken and independent, and not averse to argument; but, even at this time, when he was scarcely out of his teens, he impressed the foreign botanists by his acuteness and knowledge. While examining these collections in different localities, he found time for arduous work in the preparation of natural history treatises of a revolutionary character. Three of these ought to be mentioned. A small octavo, "Fundamenta Botanica," gave explicit directions for the proper description of plants. The rules were laid down by the hand of a master, instead of a journeyman. Following out these rules, he published his "Genera Plantarum," illustrating in every page the advantages of precision and conciseness. But his studies were not confined to plants. He prepared a tabular view of the three kingdoms of nature, the "Systema Naturæ." These folio tables later became octavo volumes, passing through many editions, always with additions, until at last the treatise may be said to have broken under its own weight.

When his years of travel closed, Linnæus returned to Sweden to practise medicine, in default of obtaining a professorship of botany and zoölogy. At first his practice was meagre, but, later, owiug to some happy cures of the nobility, it increased rapidly. Shortly after this, he was made professor of medicine in Upsala, but soon exchanged chairs with a colleague. The colleague became professor of medicine, while Linnæus became professor of botany. He now took his permanent place at Upsala, which had not been to him so much an alma mater as an unkind stepmother, but it should be said, to his great credit, that he allowed bygones to be bygones, and behaved himself as a loyal son.

It would be tiresome to enumerate the great works on natural history which were now produced by Linnæus and his pupils, in rapid succession. Two of these treatises must, however, be specially alluded to. The times were ripe for both. The "Philosophia Botanica" was based on his earlier work. It consists of an authoritative grammar which served as a guide to botanical description at that time. The treatise took from the works of Jung and others the best possible terms in use, reexamined their exact significations, and limited their application. New terms were devised to fill up gaps, and strict rules were formulated to secure their unvarying application. The substitution of a simple binomial appellation for each organism, which had been found to work so well since its first suggestion by Linnæus, was now insisted upon, and general directions were given, all looking to simplification. The second great work was the "Species Plantarum," which exhibited in the fullest manner the excellent features of the rules proposed by Linnæus.

During much of this time, Linnæus was giving thought to the proper classification of plants. Early in his career he had devised a sort of index system for the convenient cataloguing of plants. This system was based upon the number of stamens and carpels in the flower, and was found to be so useful as to meet general acceptance. But Linnæus, although very proud of its merited success, never regarded it as more than provisional. He was always on the search for natural affinities, and he constructed several systems on a natural instead of an artificial basis. He was much hampered by his belief that all species have come down to us in definite straight lines out of an unknown past, and hence, of course, he could not clearly discern any birth-affinities. The hypothesis of origin through variation belonged to a later stage of philosophical thought, although here and there some hazardous conjectures had found their way into science.

During his life, and for some time after it, the provisional system of Linnæus held full sway—*rien ne dure comme le provisoire.* In a few of the most convenient local floras of Continental Europe one can find to-day the handy Linnæan index prefixed to the natural synoptical one. The artificial system brought to Linnæus materials from all quarters, which for mass and variety have had no parallel in the history of science. From all sides plants were sent to Upsala to be described and named, and all questions there received their answers. If one should exhume this correspondence, it would be seen that the answers were sometimes discourteous, and sometimes unfair. We ought now to let these dead controversies lie buried.

To Linnæus came honors without number. Among these was a patent of nobility. The title Carl von Linné is the name by which he is frequently known in citations, but he appears to have preferred the Latin form under which his earliest triumphs were won.

The active life of Linnæus closed soon after he had passed his sixty-fifth year. He died in 1778, the last of the naturalists who have attempted to make themselves proficient in the knowledge of the three kingdoms. Since his time, specialization, demanded by the accumulation of materials, has become year by year more minute. There is a special fitness in honoring one who was able early to mark out lines in all directions which, no matter how far specialization may go, must continue to be the lines of progress. No one can safely ignore the rules laid down by the master: Describe with precision and in the fewest terms; To each natural object assign a simple unvarying name.

GEORGE LINCOLN GOODALE.

Flammarion's Bibliothèque de Philoso-.

phie Scientifique is to have a volume on "L'Électricité," by Lucien Poincaré.

Sir Joseph Fayrer, physician extraordinary to King Edward, died on Tuesday. He was born at Plymouth, England, in 1824, and was brought up under private tuition in Scotland, continuing his studies in London, Edinburgh, and on the Continent. He took the degree of M.D. in the University of Edinburgh, and became a fellow of the Royal College of Surgeons of London and Edinburgh, and of the Royal Societies of the same cities. He soon entered the medical service of the navy and served in the military hospital of Palermo during the siege of that city from 1847-1848. In 1850 he entered the Bengal medical service, retiring in 1874. He was in service throughout the Burmese war in 1852, and served in the Indian mutiny in 1857 and at the defence of Lucknow, where he was political assistant and resident surgeon. He was created a baronet in 1896. He was honorary physician to Queen Victoria and other members of the royal family, and was made physician extraordinary to the King in 1901. He found time to write a number of books, relating chiefly to his medical experiences in India. Among these may be mentioned "Clinical Surgery in India," "Tropical Diseases," "Climate and Fevers of India," etc. He also wrote several non-professional books, among them "The Life of Sir R. Martin," "The Royal Tiger of Bengal," and "Recollections" of his own career.

Dr. Frank L. James, one of the Government experts in the "embalmed beef" investigation, died on Monday at St. Louis. He was born in Mobile, Ala., in 1841, and received his preliminary education in his native city. After 1857, however, he went abroad and studied at Carlsruhe, Munich, and Paris. He did special work in chemistry under Baron von Liebig, and also specialized his medical studies. After various adventures during the civil war he went to Japan, returning to St. Louis in 1877. Of the American Pharmaceutical Association he was an honorary life member, and of the Royal Microscopical Society an ex-officio member. He was the author of many monographs on technical subjects, among which should specially be mentioned, "The Microscope in the Investigation of Scorches and Burns on Textile Fabrics" (Proceedings American Microscopic Society, 1891). He was the editor for twenty-one years of the *American Druggist*, and the author of "Elementary Microscopical Technology."

Drama.

THE BUILDERS.

Crude as it is in its constructive machinery, "The Builders," by Marion Fairfax, produced in the Astor Theatre on Monday evening, is a piece which, coming as it does from a new female dramatist, is of more than common interest and promise. Cast in the form of Western melodrama, its actual motive deals with the efforts of two persons, a man and a woman, to overcome the effects of hereditary influence and social prejudice, and if it offers no new solution to the problems which it proposes, it at least treats them with sincerity, vigor, and some ability. The details of the story, being both clumsy and conventional, require only the briefest reference. A young engineer, son of a profligate father, shoots a man in a drunken quarrel, and is sent to prison for five years. Beginning life anew in Arizona, he achieves a great engineering triumph, being aided greatly by a female secretary, who herself is striving to obliterate the shame of having once loved not wisely, but too well. When the engineer is at the point of realizing the fruition of his most sanguine hopes—a lovely young bride, wealth, fame, honor—the secretary, Hilda Norris, who has long worshipped him in secret, inveighs against the inexorability of social prejudice, passionately protests against the injustice of the scoru of which she has been made the object, and with bitter reiteration asserts that there is no such thing as forgiveness of sin, no way to regain peace, happiness, or honor, once lost through transgressiou, no matter what the measure of repentance and amendment. To her the man preaches the gospel of resolute, indefatigable, devoted work and high endeavor as the one sure means of forgetfulness and resurrection, she remaining rebellious and incredulous. This is, really, a fine and moving scene. Presently, the engineer's past is unexpectedly revealed, and he finds himself avoided by all but his fellow-workmen. Fortunately, his pecuniary success enables him to maintain his professional position, but his affianced bride and former backers shrink from him as from an outcast. Hilda's theory of life seems to be justified, but, in the end, the hero recognizes in her a kindred spirit, and when the curtain falls, it is evident that they will continue life's battle as allies. Thus, the real issue is avoided. The two tainted wethers of the flock are forced to make common cause. Both, of course, apart from their single lapses, are paragons of virtue. The play, indeed, is very far from a masterpiece, but it reveals purpose, ideas, and a sense of actual dramatic conflict—qualifications conspicuously absent from the mass of contemporaneous theatrical pieces. Miss Fairfax enacts one of her own characters, but is less successful as an actress than as a writer. The general representation, by a stock company of practically unknown players, was unexpectedly effective and contributed greatly to the success of the piece.

Von Wildenbruch is one of those authors who, having learned the source of their strength, waste neither time nor talent in experimenting. Twenty-five years ago, in "Die Karolinger," he turned his attention to German national themes, and such successive dramas as "Der neue Herr" and "Die Tochter des Erasmus" soon demonstrated a superior temperament for the handling of particular historical stuff. In his latest play, "Die Rabensteinerin,"—produced this month in the Königlichen Schauspielhaus, Berlin, as his twenty-fourth drama—Wildenbruch's training in law and government makes itself felt, but long service in arms contributes also to the realism. The story is laid in Southern Germany in the Sixteenth Century, in the palmy days of confederation between Nuremberg and Augsburg, and a touch of verity is given the narrative by the rôles allotted the Welsers, then among the wealthiest merchants of Augsburg. The play opens with Burg Waldstein, between the two cities, where spies of Hilpold Jeronimus, the Knight of Rabenstein, raise the cry that Augsburgers are in sight and will pass through the forest in an hour. Versabe, the gypsy-like daughter of the impoverished warrior, is the heroine, and the three acts are filled with the bustle of war and the intrigues of love. The author more than maintains his reputation as one of Germany's leading dramatists, especially in his admirable technique and the clever development of the plot. The conclusion alone seems somewhat *fabelhaft*, a too sudden softening, perhaps, of the fierce heart of the mediæval man. The diction, which well becomes the piece, is exceptionally simple and direct, particularly when compared with some of the recent lines of Hauptmann or even Sudermann.

The English Drama Society began its season in London the other evening with the production of two plays, neither of which appears to have fulfilled expectations. The first, "Cleopatra in Judea," by Arthur Symons, deals with a visit of the Egyptian Queen to Herod after the marriage of Antony with Octavia. Her object, seemingly, was to induce him to make war upon Antony, whom she declared to be in love with Herod's wife Mariamne. Herod at first resolves to kill her, but finally abandons this project, although he refuses to comply with her wishes. The piece is described as well written, but vague, indecisive, and undramatic. The second, a comedy, by Nugent Monck, called "The Hour," consists largely of a debate between a skeptical student and his wealthy and ambitious friend, as to whether the latter would be wise to marry his penniless sister and thus imperil his prospects.

G. E. Morrison's "Don Quixote," played by F. R. Benson during the Shakespearean festival at Stratford, impressed the audience as a work of fine imaginative quality. The Don was represented in his idealistic character, as a man of nobler soul than his times. He is seen watching his arms, or praying before his sword, and from his lips is heard a description of chivalry that might have come from King Arthur. At the same time, the humorous scenes of the story are not omitted.

Music.

Early Concert-Life in America, 1731-1800. By O. G. Sonneck. Leipzig: Breitkopf & Härtel.

It is commonly assumed that concerts were given in the cities of Europe long before any one ever thought of such a thing in America. Mr. Sonneck's volume corrects this impression. It is true that John Banister advertised the first of his daily public afternoon concerts in London on December 30, 1672, and that there were in France and Germany, during the seventeenth century, various "academies" and other more or less private organizations that afforded occasional opportunity to pay to hear music, secular or sacred. But the actual public concert-life of German cities remained in an undeveloped condition for decades after

Banister's innovation had borne plentiful fruit in London. In Vienna, Dr. Hanslick failed to trace public concerts before 1740. Mr. Sonneck has come across a reference to a Viennese benefit concert In 1728, but these entertainments seem tc have been sporadic. The earliest allusion to a public concert in our own country, of which he is aware, dates back to 1731; but it is more than probable that still earlier ones will yet bc brought to light, especially in the records of life in the South. where there was a nearer approach to a European musical atmosphere than in the North.

It is to Charleston and the South that Mr. Sonneck devotes his first chapter, which is followed by three others, on Philadelphia, New York, Boston and New England. Although it was in Boston that, so far as now known, the first public concert was given, the author chose to begin with Charleston, "be it only to emphasize the fact that New England's share in the development of our early musical life has been unfairly and unduly overestimated to the disadvantage of the Middle Colonies and South." This New England bias on the part of preceding historians has resulted in the general belief that during what Mr. Sonneck calls the formative period of our musical history, from 1720-1800, sacred music developed more rapidly and received more attention than secular. This he shows to have been true only in New England, not including Boston:

Undeniably the interest taken in music by the Yankees was keen, earnest, and sincere, but, outside of Boston, it moved predominantly in the narrow channel of what we call psalmody, cultivated by the innumerable singing schools and singing societies. For instance, where we find in the newspapers one advertisement of a dancing master or a musician anxious to teach the German flute, harpsichord, violin, etc., we run across a dozen advertisements of singing schools, or of the publication of the psalm-tune collections (now so scarce) compiled by Stickney, Billings, Jocelyn, Read, Holyokc, Law, Holden, and others.

Boston was less one-sided; it was "a musical city even in the eighteenth century," a city in which all forms of music soon came to be cultivated and appreciated. The limits between sacred and secular were not always closely observed here or elsewhere. It is amusing to note, in these days of Sunday plays masquerading as "grand sacred concerts," that in 1786, also, at Charleston, the entertainments recorded "were mostly theatrical performances under the disguise of concerts, the disguise being adopted to steer clear of the strong current against the theatre shortly after the war." In Mr. Sonneck's pages we come across many other reminders of the maxim that there is nothing new under the sun. There were eighteenth-century concerts at which ice-cream was served. There were concerts by composers who filled a whole programme with their own pieces. Analytical programmes were not unknown, nor was "that æsthetic abortion, the precocious child," introducing a sensational, unmusical element. Charity concerts were numerous. Charlatan teachers had their victims; one of them advertised that "the violin and German flute are taught in the space of two or three months each." There were individuals who misbehaved at concerts—rather worse than at present—"laughing and talking very loud, squawling, overturning the benches, etc.," as a music-lover complained in the weekly *Post Boy*. There were orchestra leaders conducting with their hands only, *à la* Safonoff. Critics there were, who used flowery language, speaking of "the transports of the music-enraptured soul" "soaring upon the wings of melody to its kindred skies." As for programme music, Richard Strauss and Silas G. Pratt were surely anticipated and bested by Bandmaster Hewitt, who wrote a piece "expressive of a battle" in nine movements, as follows: (1) Introduction; (2) the army in motion; (3) the charge for the attack; (4) a national air; (5) the attack commences, in which the confusion of an engagement is heard; (6) the enemy surrenders; (7) the grief of those who are made prisoners; (8) the conqueror's quick march; (9) the finale.

Mr. Sonneck devotes many of his 338 pages to the reprinting of programmes, thus giving the reader opportunity to draw his own inferences as to the taste of the time. Surprisingly popular were the symphonies of Haydn and Pleyel; much less so those of Mozart, who, however, is better represented by his chamber music. In the eighteenth century there was no rigorous distinction between orchestral and chamber music programmes, partly because there was less difference in the number of executants, orchestras being much smaller than they are now. Here is the first part (or "act") of a quaint programme performed in New York in May, 1774: "A grand Orchestry's Symphony. A French Ariette will be sung, accompanied with the guitar and violin. Mr. Caze will play his own composed music on the violin with Mr. Zedtwitz. A Concert on the Flute. A Sonada on the Spanish Guitar. The first act to end with a March."

While music undoubtedly made much progress in America during the nineteenth century our author nevertheless is justified by the facts he has so busily collated from scattered files of old newspapers in asking: "how many American cities of fifty thousand inhabitants are there to-day with orchestral subscription concerts such as Philadelphia and other smaller cities enjoyed more than a century ago?" This, however, relates chiefly to instrumental music. Choral concerts were few in number, and the efforts to enlist the services of the church choirs and singing schools succeeded only temporarily or failed entirely. "On the whole, vocal music was represented on the programmes of the eighteenth century only by airs, duets, etc., from oratorios and operas, by popular songs or by catches and glees." The opera, to be sure, served to counteract the preponderance of instrumental music in the concert halls. To it, we are glad to note, Mr. Sonneck purposes to devote a companion volume under the title of "Early Opera in the United States." It is to be hoped he will have the leisure and patience to make it the equal of the present volume, which is the most scholarly, comprehensive, and impartial source book on its subject yet written.

Would it be possible in Germany, France, Italy, or any other country, to raise a fund of $35,000 for a composer of music whom illness has prostrated? It has been done in this country. About a year ago the Mendelssohn Glee Club of New York started out to raise a MacDowell fund of $100,000. Of this, more than one-third is now in hand, and the work will continue next autumn. New York contributed $16,237. The committee announces that it has received from Mr. Hamlin Garland an offer to deliver a lecture on Edward MacDowell and in aid of this fund.

Organists will welcome the first complete English edition (published by Novello and Company) of Bach's works for their instrument. The text has been made to conform in the main with that of the edition of the German Bach Society. Suggestions as to the rate of performance and general treatment are also given. The editors are Dr. J. F. Bridge and Dr. James Higgs.

The piano quintet of the American composer, Edgar Stillman Kelley, has already been played three times in Berlin. He has just completed a string quartet which three organizations have requested permission to give in public next season.

Paderewski has nearly completed a new opera. It is called "Sakuntala," and is based on a story by Catulle Mendès.

Art.

THE ROYAL ACADEMY.

LONDON, May 2.

The Royal Academy has opened, and the Royal Academy is what one expects it to be. With the walls of Burlington House crowded from floor to ceiling, it is only at rare intervals that any ambition is revealed save the desire to follow the more successful along the path of fame or popularity. The sham Sargents are many. Mr. Abbey has found copyists who have studied his methods so carefully that it is some little while before you realize the absence of Mr. Abbey himself. Imitations take their good where they can find it, anywhere, from the early English water-color painter to the Pre-Raphaelite. But for genuine observation of nature at first hand, for any personal convictions, any honest endeavor to see things or express them for one's self, you look almost in vain. It is curious just now in England that the younger men seem to have attained, without a struggle or suspicion of revolt, the same academic mediocrity and polite impersonality as their elders. At the Academy you might think it almost an indiscretion to hint that such a thing as Beauty or Art exists. And to crown the absurdity, the Academic answer to this year's invariable complaint of good work rejected, is that the work was too good to be hung under the system of selecting and hanging observed at the Academy from time immemorial. Stupidity could scarcely be carried further even by Royal Academicians.

Under the circumstances, it is not surprising that one must turn again to Mr. Sargent for the chief interest of the exhibition. He is not, except in one instance, at his best; he has no huge group like the Misses Hunter, or the Marlborough family; but his technical skill, his knowledge, in

itself, is a relief after the weak, hesitating renderings of the usual tailor's dummy and royal puppet. All his portraits at the Academy are of women, and in almost all of them—there are five—he gives little more than this dexterity. I do not make light of it—the folds of his draperies, the gleam of his jewels, are a pleasure to the eye, after the labored, or feeble, or flashy detail of the Academic portrait. But then, Mr. Sargent can give more, and there is one portrait, Lady Sassoon, to prove it. It is a three-quarters length; she stands, wrapped in a voluminous cloak of black silk, with the pale rose of the lining showing here and there, and her jewelled hands losing themselves in its ample flow; on her head is a great feathered black hat. The painting of the cloak and jewelled hands and hat is a triumph. But the greatest triumph of all is the face, with its beautiful, quiet modelling; there are none of the aggressive high lights, the swirls and trails of paint that sometimes irritate one by their superfluous insistence on Mr. Sargent's skill with his brush. It is so restrained that I heard some of the critics on press day comparing the head to a Holbein; though they would quickly forget the comparison in the National Gallery. Mr. Sargent has simply succeeded in his own way, as Holbein did with his flat modelling, in concealing the means by which the effect—the truth of it—is obtained, and he has done so at no sacrifice of character. The portrait, as a portrait, might remain the type of the fashionable woman of the twentieth century, as Lely's and Kneller's Shepherdesses and Dianas have remained for us types of the beauties of the Court of Charles II Mr. Sargent's other portraits show something like fatigue or indifference, the reason perhaps of a rumor that he intends to desert portrait painting for landscapes.

Several Academicians supply the accustomed Academical portrait—Frank Dicksee in his most sentimental mood, Mr. Herkomer in his most prosaic, Mr. Ouless and Luke Fildes, in their most commonplace. Mr. Cope, in true modern fashion, has been paralyzed before royalty, and produced a sleek and characterless presentment of the King that must surprise His Majesty himself. Was it for this, one asks, that Velasquez painted Philip, and Holbein, Henry? Mr. Orchardson, I begin to feel, has repeated the same scheme of color, the same treatment, until what was charming and distinguished and refined in earlier work has dwindled into a convention that weakens with the years, and his two Presentation Portraits—of men—strike me as little more than distant reëchoes of the Sir Walter Gibbey and other fine performances in past Academies. M. Blanche's Miss B. Capel, well placed on the canvas, well posed, its rendering of shimmering stuffs clever and amusing, grows in distinction from its surroundings—in Paris, they may disdain beauty, but they know their trade. And at least one portrait group, by George Lambert, has a vivacity that calls immediate attention to it, though it is not as well hung as its many qualities deserve. There are four figures: two women and two children, standing on what appears to be a breezy hilltop, against a wide, romantic sky. This choice of scene and background has a suggestion of Furse's Diana of the Uplands, certainly "the picture of the year" of a few Academies ago. One of the women wears her modish gown with a dash, a provocation, that recalls the Spanish women of Zuloaga; one of the children, a small boy, bareheaded, in short breeches and sandals, is distinctly out of Velasquez, if masquerading. It is a curious jumble of inspirations and influences and borrowings. But there is good painting in it. A baby, with its little skirts drawn up about its legs, as it toddles in the foreground, is an extremely able and sympathetic piece of work, while the whole thing is alive. The painter has not been afraid to betray his own interest, he has not been ashamed to paint with vigor and enthusiasm; which is exactly what Associates of the Academy, like J. J. Shannon and Mr. Henry, seem ashamed of doing.

Academic anecdote flourishes, but so sedately that no longer would a special rail be needed to keep off the crowd. Frith's Derby Day and Railway Station were worth all the pretentious moral lessons and domestic incidents of his successors, though these may tell their stories on a more colossal scale in their eagerness to catch the popular fancy. F. Cadogan Cowper tells a mediæval tale: "How the Devil disguised as a vagrant troubadour, having been entertained by some charitable nuns, sang to them a song of love." In the telling, Mr. Cowper owes much to Mr. Abbey. His picture, however, might be ignored with the rest were it not for the clever painting in it of the stained glass of the Fairford Church windows, reproduced with a realism that would have satisfied Ruskin, but that does not, and cannot make a picture. Mr. Abbey's other most devoted follower is Frank Craig, who in a huge arrangement of Joan of Arc on the battlefield, makes good use of those red lances of Ucelli's battle scenes that have so often served their turn. An attempt to give the light and atmosphere of a cool, sober, gray room is made by L. Campbell Taylor—whose name is new to me—in The Rehearsal: a group of five men and women, in early nineteenth century dress, at the piano, and with violin and 'cello But it is painted on an enormous canvas, and you think regretfully of the restraint of the wise Dutch masters in treating subjects of the kind. Mr. Taylor understands his Academy. It seems he has himself hitherto painted on a smaller scale, and received no favor in Academic eyes; his first big picture is at once bought for that unfortunate Chantrey Collection out of the bequest administered by the Academy for the relief of Academicians and encouragement of the young. Mrs. Swynnerton's Oreads is one of the few pictures that rise above the prevailing dulness. No other woman in England has her ability and force. But she will not let you forget it by the slightest concession to charm or beauty. Her Oreads, nudes grouped on rocks rising from a brilliant blue sea, are studies of models for whom loveliness of form could never have been the recommendation, and the flesh tints are as unpleasantly violent and harsh as the poses found for the figures and their grouping. This absence of grace, this violence of technique, is no less marked in her portrait of two children daintily dressed and seated in front of an open window that looks out on a stretch of lawn, vivid in summer green and sunshine; it is a surprising study of values, but marred by a coarseness, tending to brutality, in the figures of the two little girls; as if the artist were afraid to lose her masculine grip of things if she ventured upon the slightest approach to tenderness or refinement of handling.

Landscape is rapidly becoming a lost art in the Academy. You might think that Constable had never lived, nor the French Romanticists carried on his tradition to greater splendor. You might doubt that *La peinture claire* and *en plein air* had only recently been familiar terms in the studios, and that one *Ism* after another had sprung from them in the painter's impassioned determination to solve the problems of light and air. All trace has disappeared of the school of "naturalistic painters," who sprang up at Ruskin's bidding, camping out face to face with nature, selecting nothing, rejecting nothing, scorning nothing; and they, in their most extreme phase, would be better than the present Academic school, building up a landscape according to the approved standard, that it may fill its annual place at Burlington House. Only two or three men seem to be working with any real personal feeling, any respect for great traditions. Alfred East is one of the few. He rejects and selects in defiance of Ruskin, going to nature for the material to construct a dignified, decorative design on his canvas; or if he find nature prodigal in supplying a design he could not improve on, as in the case of Durham Cathedral on its wooded height, he is glad to accept it as it is. This preoccupation with design gives his landscapes a distinction as you see them here. But he has not yet managed to conceal his means; you are conscious of the machinery; the composition, admirable in intention, is too obviously planned. The aims of George Clausen are very different. Barbizon is stamped on his work; his laborers, Building the Rick, statuesque figures in silhouette against the hot sky, are touched, almost transformed, by the tragic dignity of Millet's peasants, as they move about the homely tasks that Millet also watched in the farmyards of France. Since the days of the masters of Barbizon, other painters have gone to the country to study, not so much the heroism of labor as the magic of sunlight, and they too have influenced Mr. Clausen. At the foot of the rick, where the hay is tossed up with a solemn rhythm of movement, is a little group of fowls brilliant in sunshine, that Monet could but approve. Mr. Clausen has managed fairly well to combine these two different interests in his picture.

But it is hard to reconcile with these qualities a curious convention adopted for his trees, the leaves looking as if carved, their texture and quality almost that of sculpture. Barbizon again breathes from the canvases of Edward Stott, but Barbizon with its sentiment shorn of tragedy, lightened, attenuated. Lovers wander through the shadowy spaces of his pastures in the afterglow, the "belated" cattle creep peacefully homeward through the twilight lanes—it is the tenderness of the country that appeals to him, a tenderness that threatens

to open a pitfall of sentimentality at his feet. And then, just when one is regretting some loss of the old freshness in his treatment of these themes, one comes upon a passage that proves him as accomplished as ever: as in his Cottage Madonna, where the true painter's sentiment and poetry are not in the Mother with her Baby on her knee, but in the jar of sweet peas on the window sill, with the light filtering through the white curtain at the window, and filling the blossoms with sun-steeped color. Mark Fisher and Buxton Knight both show excellent work, though Mr. Fisher is reducing his methods to such a hard-and-fast formula, that his pictures vary but little in subject and treatment year by year.

The sculpture does not reach a higher level. A scandal of rejection has proved its chief advertisement, the committee, at the King's commands, having been obliged to accept and exhibit a bust of the Queen of Spain, which they had had the almost unprecedented independence to reject. Whether it justifies their rejection, or the royal interference, I cannot say, for, being more concerned with sculpture than scandal, I find I passed it by unnoticed. Alfred Gilbert has a curious group, Mors Janua Vitæ, with the beautiful detail he knows so well how to render, in a casket held by the two figures, in their draperies, and in the lovely bas-reliefs. Harry Wilson, whom it is a surprise to see here, as he has hitherto identified himself entirely with the International Society, shows a staff of office, Marischal College, Aberdeen, in silver, ivory, and lapis-lazuli, these different materials combined with fine decorative effect. There is no man to-day who has such an exquisite sense of color in his use of precious stones and substances, and the top of the staff, with its delicately modelled and wrought tiny figures in silver, is a beautiful example of the jeweller's art. Some of Mr. John M. Swan's statuettes in silver have been, I think, more effective than this year's large Orpheus in bronze. And really, there is nothing else calling for special notice. N. N.

Though there is, of course, much solid matter in the May number of the *Burlington Magazine*, it cannot be said, on the whole, to be as interesting as that sterling publication usually is. The most beautiful of the illustrations is of two views of a small portrait bust of Agrippina, carved in plasma, recently presented to the British Museum by an anonymous donor. The reproductions, from a plaster cast, give the idea of a severely noble yet charming art which goes far to justify the high praise of Cecil H. Smith: "Among all the sculptures of antiquity which challenge a comparison with it, this bust stands preëminent, not only for the consummate art which characterizes it, but for the exquisite beauty of its material." A piquant juxtaposition of names is brought about in Katherine A. McDowall's paper on "Theory, or the Graphic Muse, Engraved by Blake, after Reynolds." The section on Art in America deals with two pictures in the Widener Collection, and with two cassone fronts in the Jarvis collection at Yale. One of the pictures is Hals's unusually elegant Lady with a Rose, the other a portrait of Bianca Maria Sforza, attributed to Ambrogio da Predis. The resemblance of this latter to a portrait of the same person in the collection of the Countess Arconati-Visconti at Paris, recently reproduced in M. Reinach's "Tableaux inédits ou peu connus," is pointed out, but hardly enough dwelt on. The Paris portrait is also attributed to Da Predis by M. Reinach, but to Bernardino dei Conti by Berenson and by the writer in the *Burlington*. M. Reinach speaks of the Widener picture, formerly in the Lippmann collection at Berlin, as a beautiful replica of the Paris portrait. This it certainly is not, as it represents a younger and slenderer woman than the latter, and is therefore, presumably, the earlier picture of the two. Yet the resemblances between the portraits are too great to be a matter of chance or of their common likeness to their original. Witness especially the escaping wisp of hair, very faint in the Widener picture, so marked in the other that M. Reinach supposes it to be "a bandeau passing under the chin and serving to hold on the coiffure." It would seem that whoever painted the later portrait based it upon the earlier one rather than upon the life, giving it a little greater age and changing the costume and jewels slightly to bring it up to date, but having no fresh sittings for it.

E. P. Dutton & Co. publish two volumes of lectures delivered before the students of the Royal Academy by George Clausen, A.R.A., professor of painting, entitled respectively "Six Lectures on Painting" and "Aims and Ideals in Art." Mr. Clausen is himself a painter of very respectable achievement, and is evidently also a man of some breadth of culture and judgment, able to appreciate other qualities than those of his own work. He is possessed of no extraordinary literary skill, but his judgment is sound and his mind clear, and he makes many shrewd remarks. His lectures must have been valuable to the audience for which they were intended, and may now be read by a more general public with both pleasure and profit.

Two French artists have just died: Félix Régamey, painter of Oriental subjects, whose work is represented by a collection of forty pictures at the Musée Guimet; and Eugène Girardet, member of the Société des Artistes Français, and also a painter of Oriental subjects.

The death is announced from Berne of the Swiss sculptor Alfred Lanz. His monuments to Pestalozzi at Yverdon and to Ruchonnet at Lausanne are widely known.

Finance.

THE QUESTION OF GOLD EXPORTS.

A sudden rise last week in the rate of exchange on London, to a level close to that at which gold exports from here would become profitable, marked an interesting change in the money market. The prolonged maintenance of the foreign exchanges in favor of New York, and the consequent prolonged absence of gold exports from this country, have been among the most striking events of the period. Ordinarily, the United States sends to Europe, during some months of the year, a substantial amount of gold, such exports being offset by imports of gold from Europe at some other season of the same year. Thus, in the fiscal year ending June 30, 1905, we sent $42,943,000 gold to Europe and received $7,494,000 from thence; in 1904, our gold exports to the same quarter were $68,476,000 and our gold imports $23,978,000. The remarkable fact about the past two years of our international finance is that since July, 1905, exports of gold from here to Europe have virtually ceased. Precisely $176,000 has gone out in that interval to England or the Continent. While sending out so utterly insignificant a sum, our import of gold from Europe, since midsummer of 1905, has footed up $100,000,000. In the face of this record, a movement of foreign exchange such as promises resumption of gold exports is a matter of much financial interest.

Its significance may perhaps be best ascertained by inquiring what has been the reason for the absence of any gold exports to Europe, during the past twenty-two months. Fundamentally, it might be explained by the very great industrial activity and financial prosperity of the United States. Gold moves traditionally from other nations to the ports of a nation thus favored. If it comes for no other reason, it is likely to come because the demand for capital by the country's industry fixes a high bid on the money market; in response to which, foreign markets remit from their own stores of capital. Usually, also, foreign investors in securities make purchases on the Stock Exchanges of so prosperous a country. Both these phenomena have been witnessed in the United States during the period beginning with July, 1905; and during just this time the New York market has witnessed such rates for money as had not been seen in a generation. It was in December, 1905, that demand loans rose to 125 per cent. in Wall Street, following this with the 60 per cent. rate of January, 1906, the 30 per cent. of April, the 40 per cent. of September, and the 36 per cent. of December. Time loans and merchants' paper touched, in the same period, the highest autumn rates since the early seventies; between November, 1905, and December, 1906, inclusive, the reserve of the New York banks went on seven separate occasions below the legally required ratio to liabilities. That European markets were heavy lenders of capital to New York, in response to these high bids, was equally well known; such remittances became so abnormally large, last summer and autumn, as to force the unusual protective measure of an advance in the Bank of England's official discount rate to 6 per cent.

Necessarily, remittance of foreign capital on such a scale will move international exchange in favor of the country to which the money comes, and will make almost continuously profitable gold shipments to that country. As it happened, there was still another important influence serving to hold the foreign exchange in our favor. The burning of San Francisco during April, 1906, threw on the European fire insurance companies a burden of more than $50,000,000 indemnities. These obligations had to be paid in cash, and remitted promptly to America. The ordinary financial, commercial, and industrial incidents of the period since July, 1905, are sufficient explanation of the unprecedented gold import, and, inferentially, of the absence of export of gold to Europe,

So much for the past. Why, however, should the movement of international exchange have turned, this month, to such a degree that gold exports are now expected? On the surface, the first and most obvious reason is, that the bid of this country's markets for European capital has practically disappeared. Since last year's partial corner of enormous blocks of speculative securities, by Wall Street financiers, was broken by the forced liquidation of last March, New York's demand for such assistance has ceased. When last October's extravagant money rates were quoted in Wall Street, the lending rate at London, Paris, and Berlin was 2 to 5 per cent. lower than New York's. At the close of last week, Wall Street quoted call loans at 2½ per cent. and time money around 4, while at the same time London was charging 3 per cent., Paris 3½, and Berlin 4½, all three markets having lately been still higher. In other words, the tables were turned in the international markets; there was not only no longer any inducement for Europe to remit its capital to New York, but its natural course was to call home what still remained on loan in the American market.

Presumably, also, a good deal of the foreign capital, placed in our stock market a year or more ago, was withdrawn through realizing sales, when prices reached their abnormal heights of last winter. Return of this money to its foreign owners would similarly serve to move exchange in favor of Europe's markets. Even the merchandise movement between this country and the outside world has been much less in our favor lately than at the height of the business boom. Large as our excess of exports over imports still remains, it was $54,000,000 less, in the ten months ending April 30, than in the same months of the preceding fiscal year. Furthermore, this decrease in the "export balance" was a consequence, not of actually diminished exports—on the contrary, they were $120,000,000 greater than in the ten-month period a year ago—but of imports increased by $174,000,000. This, as all students of economics are aware, is a familiar symptom in the later stages of an excited industrial boom.

There is, then, nothing astonishing in the fact that, for the first time in twenty-two months, the gold movement seems now to be turning against New York. That an outflow of gold, sufficiently large to inconvenience the bank reserve, is likely to ensue, does not necessarily follow. How large the export is to be depends in the main on two considerations—first, whether the New York money market will continue to quote low rates, or will once more bid for outside capital; second, whether our export trade in grain is to be impaired by a harvest shortage.

Burton J. Hendrick has done well to reprint in permanent form the series of valuable articles upon life insurance which he contributed last year to one of the popular magazines ("The Story of Life Insurance," McClure, Phillips & Co.). These articles, doubtless, are familiar to many of our readers. Mr. Hendrick begins with the scandals growing out of the "surplus," traces the notorious career of Henry B. Hyde and the others who contributed to the demoralization of American life insurance, gives a sympathetic account of the reforms secured through the good offices of Elizur Wright, presents a concise history of the "tontine," and describes the race for business, the speculative management, and the actual corruption disclosed a couple of years ago. In part, the story is familiar; but apparently it cannot be told often enough, and no one has told it so well as Mr. Hendrick. Again and again disclosure has followed scandalous mismanagement and breach of trust, but it seems impossible to work a permanent cure—at least in the larger companies. In writing a trustworthy popular account of the evils that have attended the insurance business, Mr. Hendrick has performed a distinct public service; his volume should reach a wide circle of readers. By some oversight of the proofreader "tontine" has been changed to "combine" in the table of contents.

BOOKS OF THE WEEK.

Adams, Andy. Reed Anthony, Cowman. Boston: Houghton, Mifflin & Co. $1.75 net.
Adams, Joseph H. Harper's Outdoor Book for Boys. Harpers. $1.75.
Aldrich, Fred Davis and Irving Lysander Foster. Elementary French. Boston: Ginn & Co. $1.
Baedeker's Southern France and Corsica. Imported by Scribners. $2.70 net.

By the Author of "JOSEPH VANCE"

ALICE-FOR-SHORT

By William De Morgan

575 pp. $1.75. Ready May 25th.

The Nation said of "Joseph Vance:"

"We commend it with something more nearly approaching enthusiasm than is usually expected of the jaded novel reader of tradition. . . . Seriously, we take this to be a novel of uncommon quality. In detail it is often brilliant, sometimes exuberant—a work of true humor."

The Dial said:

"The fictional surprise of the season. A delightful story."

"'Alice-for-short' has all the humor and literary charm of the earlier book, with an absorbing plot and a good love story. It is a singularly human narrative of English life, reviving the best traditions of the Victorian era in its method and flavor, yet a story of recent years.

Early in the story a little London waif tells a friendly artist that she is called "Alice-for-short." Alice comes to know this artist's friends and his family. Their fortunes form the theme of this noteworthy and remarkable book.

HENRY HOLT & CO 29 W. 23d St. New York.

Memories of the Months

Fourth Series

By the Right Hon. Sir HERBERT MAXWELL, Bart., F.R.S. Large crown 8vo. With Photogravure Illustrations. $2.50.

LONGMANS, GREEN, & CO., New York

The Nation.

NEW YORK, THURSDAY, MAY 30, 1907.

The Week.

There have been a good many pernicious political doctrines preached of late years, but Senator Hemenway's seemingly comfortable counsels are worse than any of them. "No matter who may be nominated by the [next Republican] convention," he says, "you may rest assured that a wise choice will be made, for, with such men as Fairbanks, Taft, Cannon, and Knox to choose from, how can any mistake be made?" In other words, he seems to think, as any ordinary voter might, that it really makes very little difference who is nominated. Yet in the last month the Protective Tariff League has unmasked Mr. Taft and shown him to be a free-trader, Fairbanks's reactionary designs are known to all, Knox was a corporation lawyer, while Cannon is as objectionable to the revisionists as Taft to the stand-patters. Mr. Hemenway remarks that neither bouquets nor brickbats are expected for the Fairbanks boom, when President Roosevelt speaks at Indianapolis. But we must have these things. It is not right, after some years of government by bouquets and brickbats, to speak as if neither mattered. The axiom that things equal to the same thing are equal to each other, if accepted, would play havoc with politics. Next we shall have some one saying that a Republican national convention could safely be left to choose the next Presidential candidate, acording to its own judgment and convictions at the time.

Speaker Cannon's remark, "I would rather that the people wished me President in their hearts than that I be made President," is almost suspiciously well-adapted to the quotation book. It is, in fact, faintly reminiscent of the modest utterances of many other great men. The trouble is that, while everybody knows who is President, nobody can tell for a certainty who the people "wish in their hearts" were holding that exalted office. Yet there is a distinct place in our public life for the man whom few would think of really making President and yet whom hosts of fellow-citizens would like to see honored in every possible way. Mr. Cannon is such a man on the Republican side, and ex-Senator Cockrell on the Democratic. The two most impressive unorganized "demonstrations" of recent years were given these veterans—Mr. Cannon's in the House of Representatives, Mr. Cockrell's in the last Democratic National Convention. Neither ever stood more than the remotest chance of nomination, but both occupy places in the hearts of their countrymen that most of our actual Presidents would have envied.

Postmaster Willcox undoubtedly made a strong point when he referred the other day to Secretary Cortelyou as proof that entering the civil service does not mean the stagnation of every one who takes the examinations. Mr. Cortelyou will long be the classic example of the Cabinet Minister who rose from the ranks of the civil employees. But whether he is not to remain merely the exception which proves the rule, time alone can show. Men of parts undoubtedly take the examinations; some of them resign from the service before their ambition is quenched, while others succumb early to the narcotic influence which comes with a permanent position, easy hours, and a fixed routine. Mr. Cortelyou was fortunate in being transferred to the White House, than which there is certainly no more broadening or interesting field of activity, and he was thus given the opportunity of impressing his personality upon two Presidents, while remaining very much of a mystery to the public at large. Dozens of men in other departments in Washington may have Mr. Cortelyou's admirable qualities, and still others, but lack the chance to bring them to the attention of a superior. No one contends to-day that our civil service is perfect, least of all those who are most devoted to its purity, but with time it should yet be made a genuine career for men of talent eager to get ahead and capable of assuming great responsibilities, as Mr. Cortelyou has shown himself.

The action of the National Association of Manufacturers, in voting to raise a fund of $1,500,000 in the next three years with which to combat the labor unions, is another significant sign of the times. It will be denounced, of course, by the unions as a corruption fund. If any part of it is used for the purpose of buying special privileges or interfering with the lawful rights of workingmen, the Association will properly be classified among those whom the President has so often denounced as the real enemies of the people. We do not believe that this is the purpose of the Association. Its members wish to control their own affairs. They do not object to labor unions as such, but to the lack of responsibility of their leaders. These men are too often corrupt and criminal, perfectly willing, as in Chicago, to bring misery to hundreds of families by calling strikes in return for bribes. They habitually play into the hands of the worst types of politicians, and, as in the Moyer and Haywood case, assume the attitude of being above the law. Now, if these leaders represented all the working people of the United States, the situation would be different. But they stand for only a small minority, who insist not only upon a labor monopoly, but the right to prevent by force Americans from earning a living as they see fit.

The work of the San Francisco grand jury in returning indictments against six public-service corporations, in company with Mayor Schmitz and the fallen boss Ruef, goes to the heart of the entire question of political bribery. To punish the giver of the bribe, as well as the receiver is not only just and logical—it is effective. An indicted or threatened official may resign in the face of attack, or may seek immunity by confession or weeping in court, or, at the worst, may "take his medicine" philosophically, in the knowledge that a short term in prison may be forgotten in the calm old age of retirement which a fat bank account always makes possible. To the "respectable citizen" who buys franchises, on the other hand, the prospect of punishment must be unpleasant, to say the least. In this connection, too, we cannot but commend the action of Judge Coffey in exacting heavy bail—$10,000 on each count in the indictment. The United Railways was made to deposit no less than $560,000 in securities in behalf of its four indicted officials. This is in line with action taken recently by other courts in mulcting guilty corporations in really appreciable sums, and wounding them in their tenderest spot. It remains now for the San Francisco district attorney to press the indictments home, and to see to it that Abe Ruef receives his proper share of the punishment that must be meted out to rascals before the city can redeem itself.

Whether Secretary Root's Yale address, last week, on the reawakening of the nation's conscience, should be regarded as flattery or not, is a little difficult to say. His conclusion, from the review of various past episodes in the nation's history, is that the standard of political and commercial morality has been raised to a notably higher level. The instances which he cites prove that it indisputably has been. Unfortunately, however, the incidents to which he alludes as typical of other days were so utterly discreditable that, if we were charged as a nation with tolerating them

now, we should resent it as an insult. It is no very high praise to be told that the bribing of Congressmen by a railway construction company, the selling of appointments by a Secretary of War, the acceptance of subsidies from a foreign government by a general of the army, or the election of a notorious financial and political adventurer to the Vice-Presidency, are no longer possible. Nor is it straining compliments to point out that the days when Gould and Fisk habitually bribed corrupt New York judges, fortified their offices with hired prize-fighters, and moved the books and headquarters of a great railway from New York to New Jersey in order to escape the law, are gone forever. We fully agree with Mr. Root, however, that this lifting of the standard has been due quite as much to the raising of the general idea as to improvement in the ideals of corporation managers. That the practices of such notorious scoundrels as Jay Gould and his railway associates had come long ago to be repudiated in disgust by the new generation of railway men, and this without any necessary coercion by outside public opinion, we see no reason for doubting. But it will hardly do to flatter ourselves too much on the new sensitiveness of the financial conscience, when we have so near at hand such episodes as the sharp practice in Metropolitan Street Railway finance, during 1902 and 1906; the swindling operations in various famous steel-trade "promotions," during 1899 and 1902, and the use of life insurance funds by speculating trustees in 1901. Possibly it is even true, as Mr. Root declares, that "the standard of probity and fidelity among the corporation managers of the country is higher now than it ever has been before." But the greater safeguard lies in the other fact, also stated by the Secretary, that "our people demand that a more rigid rule of morality shall be applied."

The fact that immediate disarmament is impracticable is no reason for shelving its present discussion. Its impracticability lies wholly in the need of a more active and vigorous public sentiment, and public sentiment was never yet engendered by a cautious fear of asking for some new concession to righteousness and civilization a little ahead of time. If some "statesman" of an earlier day could have persuaded Phillips, Whittier, and their kind that *abolition* was a word not to be uttered until minor mitigations actually within reach were secured, the chains would still be clanking in the Southern cotton fields. There is no real progress for the cause of international peace apart from a vigorous campaign against the folly of ever-increasing preparation for war, and the Mohonk Conference will find that it has weakened its moral power by listening to advice emanating from sources not really in sympathy with the cause for which it is supposed to stand. It might as well be abandoned, if it is to continue as timid and cowardly as it was last week—not even daring to follow Secretary Root's advice and ask of the Hague Conference more than the Government could.

"If it were more generally known in the United States that the best cottonseed oil is equal in purity and healthfulness to olive oil," said Major Carson, chief of the Government Bureau of Manufactures, at Jamestown, the other day, "the demand for cottonseed oil at home would expand to a point that would seriously interfere with the profits of foreign olive oil manufacturers." If the American people, after using cottonseed oil for generations, in its thin disguise of olive oil, does not yet know its good qualities, the case might as well be given up at once. Of course, there is an immense amount of nonsense about substituted articles of this sort. It may well be that, if cottonseed had been a costly foreign product, and olives a cheap by-product of another crop, we should be denouncing the olive oil man for palming off his greasy wares upon us. But the effort of cottonseed oil to make a reputation for itself is only part of one of the most interesting movements of the "fake" products now trying to be sold on their merits. It will doubtless take years for adjustments. Some deceptive wares have already disappeared from the market precipitately. Others, of which this oil may be one, are destined for prosperity greater, as well as more honest, than before.

Every intelligent theatre-goer will hope that Richard Mansfield may be speedily restored to health by the airs of his native country, and that he will be enabled to resume his theatrical work with renewed spirit and vigor. His recent illness appears to have worked some strange transformations in his temperament and ideas. It has even brought him to the point of confessing that in the days of his hot and impulsive youth he made a mistake in regarding certain experienced critics, who disapproved of his artistic methods, as base calumniators or contemptible ignoramuses. He has discovered, as the Master of Trinity once observed to the undergraduate who contradicted him, that we all make mistakes, even the youngest of us. That is a valuable lesson to learn. When he has mastered it more completely, it may occur to him that the candid critics may not have been wholly responsible for the loss of the fortune which he deplores. Otherwise, he might find himself compelled to admit that the laudatory notices, of which he has had his full share in these later years, were among the chief causes of his prosperity. A little while ago, he announced his irrevocable decision to retire from the stage at the end of three years. It is good news to hear that his present intent is to remain upon it indefinitely, but in the character of a star, not as a manager. Is it possible that he meditates an engagement with the Syndicate, which he once defied and denounced in more outspoken fashion than he ever did the critics? This, surely, would be for him a huge mistake in every respect, except, possibly, the pecuniary. Fortunately, this contingency is not imminent, and in the lazy months to come Mr. Mansfield will have time for many new resolutions.

The insistence of members of the Bible Class conducted by John D. Rockefeller, jr., that notices of its meetings be sent no longer on postal cards, but in plain, sealed envelopes, like private letters, racing tips, circulars of green goods games, or cures for inebriety, betrays a singular state of mind. Many of them say that they live in boarding houses, where one's right hand or right-hand neighbor seldom remains in ignorance for more than a few minutes of what one's left hand or left-hand neighbor is doing. They do not want to be twitted about belonging to the most celebrated religious fellowship in America. Their neighbors hint that the class must be subsidized or granted rebates in some underground fashion, and this is not pleasant for those who know that there is nothing of the sort. It takes vastly more moral courage in these days for the poor and struggling to fraternize with the excessively rich than for the excessively rich to hold out the helping hand. But, if this kind of moral courage is not engendered in this paragon of Bible classes, then where, in a selfish and hypocritical world, are we to look for it?

The announcement is made at Harvard that to Alain LeRoy Locke of Philadelphia has been awarded $250, the first of the three Bowdoin prizes given annually to undergraduates for the three best literary essays. The interesting fact about this is that Mr. Locke is the young colored man who recently carried off the Rhodes scholarship from Pennsylvania over a number of competitors. The Bowdoin prize is the most important bestowed at Harvard. This, we are inclined to think, shows conclusively that Mr. Locke has "forgotten his place." It is trying enough to have him beat our white boys for the honor of going to Oxford; but that he should now carry off the Bowdoin prize by an essay on Tennyson of really unusual literary merit, will be regarded in some circles, we fear, as seriously threatening the foundations of our Anglo-Saxon civil-

ization. It is really very cruel of Mr. Locke. True, he has two generations of educated parents behind him, but this is no excuse. We very much fear that the negroes are determined not to stay in the places assigned to them by their mental superiors.

The Paris press derives a good deal of amusement from the German Emperor's act in ordering the removal of the statue of Heinrich Heine from the grounds of his recently acquired Villa Achilleion, in the Island of Corfu, formerly the property of the unfortunate Empress Elizabeth of Austria. It would have been miraculous, remarks the *Temps*, if the King of Prussia had extended his toleration to one who signed himself "Heine, emancipated Prussian." The Germanic nature, this journal goes on to say, cherishes its hatreds; and it quotes Heine himself as authority for the fact that the Germans have never forgiven the French the execution of Conradin, the last of the Hohenstaufen, by Charles of Anjou, in 1268. The Kaiser's action does give rise to the question whether the fame of Heine is waning in Germany. That the contrary is true outside of Germany, there can be little doubt. But William II. is undoubtedly representative of his nation, and he has our own President's infallible instinct for voicing the prevailing sentiment of the moment among the great mass of his subjects. Is it possible, then, that, in a period of intense patriotic self-consciousness like the present, Germany is turning against her great mocker and cosmopolite, who was also a great lyric poet?

If the rejection of the Irish bill leaves the Liberals looking rather chop-fallen, it has caught the Tories looking very foolish. They had made all their preparations for a resounding fight against the measure. There was to have been an immense Unionist meeting in London, early in June, to denounce this new attempt to rend the Empire; and all the changes were to be rung on the perfidy of the Liberals, and the treason of Irishmen. This artificial excitement will now scarcely be indulged in. What the Irish themselves have rejected as a mere nothing, the Tories cannot erect into a terrible portent to alarm the nation. And they have further grounds for uneasiness over the mistaken action of the Nationalists at Dublin in putting an end to Irish legislation at this session of Parliament. This will leave the Ministry free to turn their hands to other measures. One of these was hinted at in the Prime Minister's speech at Manchester, the other day. It is the question of land reform. On this subject there is a vast stirring of public opinion. The movement for securing small holdings of land for laborers and farmers, for increasing the security of tenure for those who rent land, and especially for readjusting the taxation on land, which is often grossly inequitable, is making great headway. If the Government resolutely press a bill, embodying the popular demands, it will be an exceedingly awkward thing for the Lords to throw it out. Indeed, it might furnish the best of chances to go to the country on the issue of reforming the House of Lords. This is the reason why Mr. Balfour speaks so bitterly about a possible land bill, and why it causes such searching of heart in his party.

The latest report to the German Reichstag of the development of the Kiao-Chou colony is of a more encouraging character. It covers the period from October 1, 1905, to October 1, 1906, during which the income of the colonial government rose from $250,000 to $342,600, or 37 per cent. The value of the commerce passing through the harbor of Tsing-tau rose from 32,400,000 Mexican dollars to 39,400,000. This does not mean that the actual trade of the colony has grown to that extent, for Tsing-tau is a port used by the merchants of the interior to ship their goods, which, going either way, pass through German territory. Indeed, this transitory character of the trade of the colony is one of the greatest difficulties confronting its administrators. It is so dependent upon the *Hinterland* that it can be but slowly developed into a separate state. None the less, it profits by the shipping in its harbor, which increased by 50,000 tons in the year under consideration, while the passenger traffic of the railway rose from 780,228 persons to 811,285. The coal traffic is steadily increasing, owing to the development of the German mines, which gave 13,716 carloads to the railroad to haul. As there has also been a continual improvement in the judiciary and school systems, this report must cheer the Reichstag not a little, for from Africa it has had nothing but bad news for several years past.

Though the reported uprising in Kwan-tung has so far assumed no definite anti-foreign character, the probability that the rebels may turn their arms against Europeans, as well as against the local mandarins and the dynasty, is not at all remote. All accounts agree that the feeling against foreigners has been steadily growing since the great war, and that progressives are competing with reactionaries in proclaiming fervid principles of patriotism and national self-sufficiency. The native press, which has experienced such a remarkable growth of late, is hostile to the white man's influence, an attitude which is generally explained as due to the fact that most of the newspaper writers are young men fresh from their studies in Japan, and eager for radical measures looking towards national regeneration. There can be little doubt, however, that under the guise of patriotism the reactionaries have succeeded in winning the sympathy of the court away from ideas of progress. This has been made manifest by the partial eclipse of Yuan-shih-kai, viceroy of Chili, and the shelving in the governorship of Mukden of his protégé, Tang-Shao-Yi. He, at Peking, had exercised a powerful influence for progress in connection with the Foreign Office, the railways, and the maritime customs. The rebellion in the south is very probably the response to the reactionary course of the Government. In general, there is no lack of evidence that China is fast mastering the theory and practice of revolution according to the latest methods. Socialist literature in Chinese translations is being circulated in the north, and dynamite seems clearly to be coming into vogue at Tien-tsin and other advanced towns.

Rumania, from present indications, may soon join Russia and China in appealing to the world for famine relief. A prolonged drought, following upon the destruction wrought in the recent peasant uprising, has rendered harvest prospects of the gloomiest. The steps taken by the Liberal Government for ameliorating the condition of the peasantry have been met with characteristic selfishness on the part of the large landed proprietors. The royal proclamation promising the enactment of laws doing away with the great agricultural trusts, establishing a rural bank for the purpose of facilitating the acquisition of land by the small farmers, and making it incumbent on the state and the large insurance companies to lease their lands to associations of peasants, has brought about a better feeling among the mass of the population. Meanwhile, the radical policy which the Liberal Government has thought it imperative to introduce, such as the intervention of the prefects for the purpose of arbitrarily reducing rents under existing contracts, has evoked a sharp protest from the large landowners, who, in addition, complain that the indemnity for their losses offered them by the Government in the form of three-year loans, is insufficient. The Conservative party, which for a long time has been split up into bitterly hostile factions, is now reported as reunited, under the leadership of M. Carp, whose views are those of the landlords. Should the Liberals be defeated in the parliamentary elections in the beginning of June, the prospects of effective agrarian reform should be dim indeed.

KUROKI ASKS ABOUT THE TARIFF.

We have received by wireless from Washington a short-hand account in Japanese of a conversation between Gen. Kuroki and the President. It shows that the distinguished visitor from Japan is deeply interested in the ongoing of democratic government, and is especially curious about the power of public opinion in this country. Of course, owing to the uncertainties of transmission, deciphering, and translating, we cannot absolutely guarantee that the following is an exact transcript of the actual dialogue at the White House, but it cannot be far wrong. Truth, after all, shines by its own radiant light. As nearly as we can make out the talk between the exalted personages, it ran very much in this fashion:

Gen. Kuroki. I am anxious to learn about American government. You have no Samurai, no nobles, no Elder Statesmen. Who then is it that decides what must be done?

President Roosevelt. Why, my dear General, with us the people rule. Elected officials are but their servants, to do as they direct.

K. But how do they make their wishes known?

R. Through the newspapers, through meetings, boards of trade, public associations, party conventions, and through the utterances of their chosen representatives. That is what we call public opinion, and it is supreme in the United States.

K. Then Congress and the Administration are compelled to do what public sentiment desires to be done?

R. Certainly. No party in power would dare to disregard a real popular demand.

K. Let me make my questions specific. They tell me that there is a strong movement in this country for tariff revision. From what I learn, the sentiment appears to be overwhelmingly in its favor. Now, why is nothing done?

R. Well, you must know that this subject is very intricate and disputed.

K. Still, are not the facts as I am informed? Do not all Democrats want the tariff lowered? Are not many Republicans demanding the same thing? Is it not true that many honorable Senators are declaring for it, and that your great Secretary of War with your powerful Speaker Cannon are saying it must be done? Am I wrong in supposing that you yourself were once a free-trader, and that you had a message ready for Congress two years ago calling for a reform of the tariff? My interpreter tells me that chambers of commerce and associations even of manufacturers are passing resolutions in favor of cutting down your customs duties. It seems clear that public opinion has declared itself in that sense. The people are nearly of one mind. Then why is nothing done? Why has the Republican party not hastened to execute the popular will?

R. Ah, but we are going to. We are going next year to promise the people to revise the tariff a year or two after that.

K. But why wait? Have you not the power now?

R. Yes, but there are great difficulties in the way. There is, for example, the Steering Committee in the Senate.

K. I have not read of that, nor has our Embassy told me anything about it.

R. Well, it is a sort of General Staff of the Republican party. It decides what legislation may be enacted, very much as your General Staff plans a campaign. And thus far it has not permitted the party to take up the revision of the tariff.

K. Is it, then, more powerful than the party? Can it refuse to let the people have their way?

R. Oh, no; but some one has to be in charge of all such matters, you understand, and these influential Senators are the ones in this case. They have much to do, you see, with providing the sinews of party war—what we call campaign funds—and this enables them to say what laws may be passed, and when. They have decided that tariff revision would be ruinous to our prosperity this year, but that two years from now it would heighten it.

K. May they not change their minds, two years from now? If so, could they not then prevent all legislative action?

R. They could, but we all hope they won't.

K. This is truly puzzling. If public opinion rules, how can a handful of men resist and thwart it?

R. The trouble is, General, that there are practical considerations which come in to delay matters. Even an army, you know, cannot move until the commissariat is ready.

K. Now I begin to understand. My experience with the Russian troops helps me. Those brave fellows could not do their best because the corrupt army contractors did not give them good supplies, and their generals were all the while overruled from court. It was not the stout soldiers, but the incompetent commanders and the thieving Government clique, who brought defeat upon them. What you mean to tell me is that your Steering Committee, with the men who pay money to your party, are the ones who are holding back the Republican army from marching to do its duty.

R. You quite misunderstand me, General. We are sure to do it, in time. But, as practical men, we have to consider opportuneness and ways and means and political strategy and party advantage and the awkwardness of doing what we have denounced our opponents for proposing.

K. Thanks for all this information. I now understand what is meant by public opinion always having its way in the United States. It is supreme unless some one has bought the power to defy it. It can do everything except reform a tariff which selfish men have paid the Republican party to keep unreformed. When I tell them about this in Japan they will be interested. Perhaps, they will be surprised.

THE LAND QUESTION IN THE DUMA.

The existence of Russia's second Parliament is probably more precarious at the present moment than it ever has been during weeks of rumored dissolutions, *coups d'état*, and conspiracies. No single violent speech brought about the dispersal of the first Parliament, and something far more serious even than an injury to the honor of the army will be needed to precipitate a crisis in the second. Such a crisis is not improbably at hand now. Up to the present we have had, on the whole, comparatively light skirmishing, but as a result of the position taken last week by Premier Stolypin with regard to the agrarian question, issue has finally been joined on the question that lies closest to the heart of the great mass of the people. The Agrarian Commission of Ninety-nine, according to the Prime Minister's statement, has adopted the principle of forcible expropriation of private landlords for the benefit of the peasants, without consulting the wishes of the Government, which is unalterably opposed to the scheme. Against forcible expropriation M. Stolypin upholds his method of gradual transfer of land through the peasants' banks, through which between twenty-five and thirty millions of acres, or about one-third of the minimum amount considered necessary to satisfy the land-hunger of the population, have already been offered for sale.

Is the Duma, then, near its end? If that body should insist on upholding the action of its commission, there would be little chance, or, for that matter, little reason, for its further existence. Its fate would seem therefore to lie in the hands of the Constitutional Democrats. Their land plan was characterized by the Prime Minister as amounting to virtual expropriation, because of the inadequate rate of compensation it prescribed. If, however, the matter of price only is in question, it is not impossible that the Constitutional Democrats may be willing to negotiate with the Government. Of the parties of the Left, as we have said before this, the Government would in that case take little account. That the Duma to them is not a place for doing business, but for carrying on revolutionary agitation, they have frankly avowed.

The Government's stand against any method of agrarian reform involving a

sudden "social upheaval" must be the cause of unlimited satisfaction to the members of the Left. Still more pleased would they be if the Constitutional Democrats should join hands with the Ministry. That storm of popular wrath which they have been waiting and working for would then burst, so they reason, over the heads of all the bourgeois parties. We find this point of view stated in a remarkable speech recently delivered by Gregory Gershuni, the Social-Revolutionary leader, who was in this country a short time ago. Defending the tactics of those revolutionary Deputies in the Duma who were exerting themselves to prevent a dissolution, he said frankly that such action was necessary in order to gain time for the great upheaval, the armed insurrection which is to sweep away the entire existing political and social structure. He pleaded for patience, for submission to *force majeure*, in order that the responsibility for the inevitable failure of all moderate schemes of reform, and notably of the Duma itself, should once for all be placed upon the shoulders of the Government.

The great argument in the revolutionary arsenal is that from the Romanofs and their supporters no good can come. Let the land be offered to the peasants in large quantities by the present Government, land enough in the total to relieve the pressing wants of the people, and who will guarantee that the peasants shall not be tricked and plundered as they were in 1861, or that they shall not be crushed under the weight of taxes placed upon their new holdings, or that they shall be protected against the exactions of the usurer and the temptations of the state vodka shops? In homely language, their case might be stated as calling not only for a new deal all around, but for a sure preventive against all cheating on the part of the dealer of the cards.

Concerning the technical questions involved in Russia's agrarian problem, it is difficult to speak in any but the most general way. When Russian public men differ among themselves as to whether the endowment of the peasants with sufficient land will cost 2,500,000,000 rubles or 7,500,000,000 rubles, the outsider should proceed with caution. Books of statistics, and such authorities as Beatrice C. Baskerville, who has written on the question in a recent number of the *Fortnightly Review*, assign from 32 to 39 per cent. of the soil to the peasants, from 35 to 42 per cent. to the Crown and the Imperial family, and about 25 per cent. to private landowners. The additional amount needed by the peasants has been computed by a Cadet leader at about 120,000,000 acres, according to recent dispatches, though Miss Baskerville quoted an earlier estimate ranging from eighty-six to ninety millions. On the basis of the latter figures this writer asserted that some twenty-seven millions would be forthcoming from the Crown, and that about 10 per cent. of private holdings, amounting to 25,000,000 acres, could be purchased within a reasonable time, as in fact has been done. There remain about thirty-five million acres to be supplied before a reasonably satisfactory solution of the problem can be attained.

But, after all dallying with figures, the problem resolves itself into the old one—how to bring about the cessation of a régime which, on the one hand, crushes the cultivator of the soil under a burden of taxes that rise frequently to the crying absurdity of "180 to 280 per cent. of the normal rental value of the holding," and, on the other, upholds as its policy the retention of the peasantry in a state of ignorance that renders intelligent cultivation impossible. Official figures give every *mujik* in European Russia, "man, woman, or child, 4 1-25 acres to live upon," enough, surely, to prevent chronic famine. But under the present régime can the agrarian question ever be settled?

JAPAN AS A COLONIZER.

The London *Times* report that a Japanese expedition of 8,000 men is endeavoring to subjugate the savages of the east coast of Formosa, indicates, if correct, a change of policy from that of the late Governor-General, Viscount Kodama. He undertook to solve the difficulty by leaving these natives severely alone; only when they have sought to leave their territory was any force applied. The civilized part of the island is protected by a frontier of blockhouses, and it was the plan of Viscount Kodama to make greater headway with this western portion before trying to conquer the savages. Japan has felt that in Formosa she is on trial as a colonizing Power, and that according to her successes there her efforts in Korea and Manchuria will be prejudged.

The Japanese are particularly sensitive to foreign criticism. Hence they are anxious that they should get full credit for what they have already achieved in Formosa. Official blue-books are always available, and these have been further reinforced by an elaborate study, entitled "Japanese Rule in Formosa," by Yosaburo Takekoshi, an excellent translation of which has just been published by Longmans, Green & Co. There is much in the facts herein related of which the Japanese may be proud. First of all, brigandage, a curse of centuries, has been put down, so that it is now safe for a young girl to travel alone from one end of the civilized part of the island to the other. Viscount Kodama was prompt to do away with military government, and substitute civil rule. If Formosa is still properly described as an "island of policemen," it is at least noteworthy that these policemen are responsible directly to the Governor-General. The taxes, it is true, are heavier under Japanese rule than Chinese, but the payments to brigands and corrupt officials have stopped, while the railroad has been built, many new roads constructed, and life and property secured. On the other hand, the farmers receive much better prices for rice, wages are higher, and business opportunities have been greatly increased. The last Japanese subsidy was paid in 1904, and the island is now self-supporting. It is believed that by 1910 Japan will have made out of the profits of her trade with Formosa all that the island has cost her.

Altogether, so far as the financial and industrial side of the case is concerned, the Japanese record has been really remarkable. For instance, the rice crop has risen from 20,529,000 bushels in 1899 to 41,598,000 in 1904, an increase of over 100 per cent. The railroad now pays for itself, the mileage having been increased from 63 to 259. There are 6,000 miles of good roads, nearly all of which were built between the years 1899 and 1902. Nearly 2,000 miles of telegraph wires have been put in service since the Japanese conquest, and the telephone and wireless telegraphy are also in use. But, while all this spells one kind of progress, the supreme test of the success of a colonizing nation is, after all, whether it is supplying a just government, and whether the governed are contented. As Mr. Takekoshi says: "New territory may be won by the sword, . . . but unless the conquering nation possesses the qualifications necessary for the wise administration of its possessions, decay and dissolution inevitably follow." Naturally, Mr. Takekoshi feels that the success thus far achieved should admit Japan "into the community of the world's great colonial powers"; he has no doubt as to the ultimate happiness of the Formosans under Japanese rule, precisely as he defends the government monopoly of the salt, camphor, and tobacco industries.

It must be admitted that, if the Japanese follow the policy laid down by Mr. Takekoshi, they are likely to do as well by the Formosans as any foreign rulers could. "Any attempt," he says, "to force our customs and social institutions upon them, and to mould them on the Japanese model, will only imperil our policy of colonizing the island without achieving any good result. . . . We should not forget that the secret of success in tropical colonization lies in winning the confidence of the natives by a liberal and wise administration, and securing their loyal coöperation. . . ." These are words that might well be posted in large letters over the Governor-General's desk in Manila. We have no doubt that the foolish and unsuccessful effort to mould

the Filipinos into the American form was in Mr. Takekoshi's mind when he penned these words.

In Korea, the problem is likely to be far more difficult. The Nagasaki correspondent of the Manchester *Guardian* has recently confirmed the reports of the growing uneasiness of the Koreans. Affairs are assuming a "menacing aspect," and the Korean hatred of their overlords is intensified by such incidents as the recent extraordinary theft of the holy Korean pagoda of white marble. The wisdom of a Viscount Kodama is greatly needed in Korea, where many of the Japanese immigrants are of a highly undesirable class. "So long," remarks the *Guardian's* correspondent, "as Koreans can be insulted, abused and imposed on without penal consequences to the aggressors, they cannot be expected to bow humbly to the new conditions." Individual cases of oppression will occur in all colonies. For this we need not criticise the Japanese too severely, but the Government which fails to suppress such conduct on the part of its subjects is open to the severest criticism. The refusal to accept letters in the Korean language for transmission in the mails is one of the natives' grievances, and it is alleged that railways, mines, timber-lands, and other property have been or are being expropriated by the Government. The outlook, therefore, for Japanese success in Korea is as gloomy as it is cheerful in Formosa, and goes to prove that many years must elapse before the final judgment can be passed upon Japan as a colonial administrator, Mr. Takekoshi to the contrary notwithstanding.

THE EXCHANGE OF PROFESSORS.

The exchange of professors between German and American universities has now been going on long enough to give some hint of its value and the trend in the future. That it has been not much more than a *succès d'estime* appears to be the general opinion in Berlin university circles. The first enthusiasm has passed away, while the benefits in the way of international courtesy and good-will are now thoroughly attained. These have been practical results of value. Beyond this, however, there is little to be said. The latest German representative at Columbia is reported to have returned to his home much disappointed. On the other side, it cannot be alleged that the lectures of any of our representatives have deeply stirred the German *Gelehrtenwelt*. The present Harvard professor at Berlin, Dr. Richards, is one of our ablest chemists. But he learned nearly all that he knows from Germany, and has to impart his own investigations in English, a language understood by only one German student in every two hundred or so. Moreover, if Germany is rich in any field of learning, it is in this one of chemistry. Hence there is danger that his lectures, or others like them, may degenerate into a pastime for some of the members of the American or British colony.

The criticism is also heard that our representatives have been too much influenced by or drawn into court or diplomatic circles. They have not understood the Berlin situation, or realized that in the opinion of the German public this exchange of professors has appeared to be more of a court fad than anything to be taken very seriously. The newspapers have made little or no mention of the American professors, beyond reporting their initial lectures. German editors care no more to translate an English discourse than ours to give space to the views of the distinguished lecturers of the Alliance Française. Even the course of Professor Burgess, who delivered his lectures in German, aroused comparatively slight interest. Whether this is due solely to the court stamp upon the whole enterprise, or possibly to a belief that it is merely another whim of the Kaiser, like his enthusiasm for yachting, we do not undertake to say. It does, however, appear that the time has come for considering the future of what ought to be a valuable institution.

The Berlin *Tageblatt* is also of this opinion. Although it disclaims any intention of criticising the American lecturers individually, it none the less feels that, if present methods are to be adhered to, "no result worth mentioning, no real moral or scientific gain, will result." The whole experiment "can only turn out to be a curiosity in the history of education." It does not feel itself at liberty to go into the reasons for this, which are many, but it has a remedy to suggest. If there is to be "any prospect of success whatever," the matter must be taken up from another point of view. In the *Tageblatt's* opinion, "not an exchange of university teachers is what is needed, or an exchange of lecturers, but of methods of teaching." Knowledge of the scientific and educational progress of the countries concerned will have value, not lectures upon American Constitutional questions, which interest only a handful, or matters chemical, on which Germany has all the learning possible. The *Tageblatt* would have not merely professors of standing as delegates to the two countries, but young and studious teachers, medical men, scientists, even apprentices in the field of pure science. Men of this type should have the opportunity to study on the spot foreign methods of teaching and investigation, in order to compare them critically with those with which they are familiar. This would, it thinks, quickly result in a gradual "reanimation of the mental views of those countries affected."

If this sounds a bit pedantic, it is none the less suggestive. It could not be expected that we could send two professors to Germany each year who would have something notable to say. To our mind, the selection of Dr. Felix Adler to represent Columbia two years hence is one of the best made, not only because of his mastery of German, but because, through his lectures on ethical culture, he will be able to interpret American life and ideals not only to select educated classes, but to the masses as well. But intermediaries of this kind do not exist in large numbers; and if they did, it is questionable whether they, too, would not pall after a while. On the other hand, if the exchange is to follow the *Tageblatt's* lines, it might easily become merely one of graduate students, after the manner of the Rhodes scholarships. That would be valuable in itself, but by no means achieve the ends originally intended.

It must not be forgotten that a certain amount of exchange has been going on for decades. Leopold Ranke spoke many times before the Paris Academy of Science, while Liebig, Hoffmann, Helmholtz, Koch, and many other distinguished men have lectured before the Royal Institution in London. Centuries ago there were plenty of foreigners to be found at the Italian or Dutch or German or French universities. To-day there are several American professors permanently at English universities; Leipzig has long had Professor Caspar R. Gregory, and we on this side have Münsterberg, who came to us from a German chair, as did Von Holst. In the temporary and simultaneous character of the Berlin exchange lies the novelty. If it can be made of genuine value either along educational lines or in the interests of international understanding of international differences, no stone should be left unturned to accomplish this end. Perhaps there is a middle way—such as the lengthening of the stay of each professor; but whether there is or is not, something must be done, ere the exchange becomes a subject for jesting.

ART IN SMALL CITIES.

Growth of interest in the fine arts, in smaller American communities, particularly in those of less than one hundred and fifty thousand population, is an encouraging indication of our national progress in other than material directions. Wherever the art centre of the country may be just now—whether at Pittsburgh, where the munificence of the ironmaster has provided ample galleries, though there is no colony of painters and sculptors capable of filling them, or in New York, with its many artists whose works, to be adequately exhibited, have to be shown in Washington or Philadelphia—the fact is certain that subordinate centres of produc-

tion and appreciation of art are all the while developing.

Prof. Charles Eliot Norton used to predict an artistic renaissance in this country when such places as Worcester and Lowell and Fall River should vie with each other in rivalry of the kind that in the best periods of Italian art subsisted among cities of substantially the same size as these New England manufacturing towns. The conditions for such competition are apparently being slowly prepared in many American cities whose habits and standards of living are distinctly *kleinstädtisch*. In the lesser industrial capitals the fine arts are cherished with ever-increasing regard—at least on the part of the women's clubs.

At all events, exhibitions of works by painters of high professional standing are to-day seen frequently in the minor cities. The wives and daughters of well-to-do manufacturers and merchants in these places invariably compel the men members of their families to attend the opening night in evening dress. Small-city folk buy pictures, too. An exhibition of paintings by contemporary American artists, arranged for Springfield, Mass., has annually sold more canvases than the New York public, reënforced by hundreds of thousands of visitors from every part of the continent, has purchased at Academy shows. Springfield is perhaps exceptional, but other cities of less than 100,000 population are interested in collections of pictures. A travelling exhibition, gathered from studios in this city, went the rounds successfully, during the past winter, of Charleston, Savannah, Tampa, Nashville, Lynchburg, and other Southern cities. Lowell, Whistler's birthplace, has an art association which has held two good exhibitions since 1905, and which now has ambitious designs to appeal, through picture shows, popular lectures, and instruction in the arts and crafts, to the artistic instincts not only of American-born middle-class people, but of the polyglot horde that has filled the factories and tenement houses of the city. Dallas, Tex., through the initiative of its art association, sees from time to time the work of painters of New York, Chicago, and Boston. The Worcester Art Museum since 1897 has been holding summer exhibitions which give not only the local public, but the world that travels through central Massachusetts by motor-car or trolley, opportunity to see some of the best things that were on view in the larger cities through the winter. There are associations for the promotion of the fine arts in such towns as Waco, Utica, Erie, Hamilton, and many more. We are, in fact, approaching such a condition as exists in Great Britain, where almost every provincial town has its "art union," with, oftentimes, a creditable museum, containing one or two Italian masterpieces, a few canvases by Sir Joshua and Gainsborough, and a sprinkling of works of the nineteenth century that suggest an answer to the question, "Where do Royal Academy pictures go when they are dead?"

Museums of art have been founded in many of the smaller cities of this country. Mrs. Hannah A. Currier, wife of a former Governor of New Hampshire, has provided for leaving an estate, of a present estimated value of more than a million dollars, to establish an art museum in Manchester. The validity of the Salisbury bequest of several million dollars having been established, Worcester, already provided with a well-equipped museum, is in a position to become a secondary art centre of great importance. Providence, Hartford, Rochester, Toledo, Pittsfield, and others have typical institutions for display of art collections.

The economic usefulness of an appreciation of the graphic arts in the minor industrial centres needs, of course, no argument—even if the exaggeration in the Manchester school's innocent belief that the study of Raphael would assist in the production and sale of ribbons, be conceded. Sculptors have long found some of their best opportunities in the smaller cities. Painters are now very generally seeking the same constituency. The field for the sale of pictures is broadening. Boston has become a much better place of residence than formerly for painters and sculptors, since the men at the New England capital have discovered that when they go into the cities of the West and South they are at no disadvantage.

The present inclination of the lesser municipalities, generally, appears to be to secure the best work, and to get competent advice as to what is best. Syracuse, neglecting a chance which twenty years ago would inevitably have been taken to spoil a public square with a conventional soldiers' monument selected from some contractor's book of patterns, lately took counsel with an eminent sculptor and secured from a limited competition a design which bids fair to give the city a thoroughly worthy monument. Again, Malden, Mass., has just put the matter of choosing both site and sculptor for an important monumental work into the hands of a committee in whose membership are painters and art critics. Such a disposition to act upon expert advice in æsthetic affairs is not the least hopeful sign of the progress of art in our democracy.

ROMAN ITALY IN THE NORTH.

I. TURIN.

It is not easy to remember that Turin, most modern and modern-looking of large Italian cities, owes its aspect to its faithfulness to Roman antiquity; and that under the present streets in the core of the town the sewers and pavements, the house walls, and even the cellars of the city of Augustus are so well preserved that they prove just how closely the lines of the old Roman streets have been followed. In fact, the city kept within its ancient limits and was surrounded by its Augustan brick walls with its colossal gateways until the sudden expansion of the seventeenth century led to their destruction. In the office of the Regional Department for the Preservation of Monuments, in the ducal Palazzo Madama, there hangs a plan of the ancient city to which every now and then some detail is added, as bits of the old streets are casually found, and which ought to be published without delay in its present form, as few archæologists, even, are aware of its existence and depend on what Promis gives in his superb but slightly antiquated book of 1869. It is true that a comparatively small subsidy would enable the department practically to complete the plan, but the Government seems unable to furnish it. My special interest lay in the study of the Roman Gates and in the place held by Turin under Augustus as one of the Keys to Italy; perhaps I may add something to Mommsen's masterly sketch of the policy of Augustus in his "Roman Provinces."

By a curious coincidence one can pass directly from the office of the Department of Ancient Monuments, by narrow subterranean stairs and passages, among the substructures of the mediæval Palazzo Madama, to the considerable remains of the principal gateway of the Augustan City, the Porta Prætoria, over and around which the mediæval dukes of Savoy built their castle and palace. It has four openings, two large central arcades for incoming and outgoing vehicles, flanked by two narrow passages for foot-passengers, corresponding to the sidewalks. All four of the Roman gates, one on each side of the city, were of the same style and size; and all, like the walls, of excellent brick work. The plan was of the usual Augustan type, even deeper than wide, with a central court and two huge flanking towers. How deep the court was in the Turin gates has not yet been exactly determined, but it can be as soon as the Government provides the funds for completing the restoration and uncovering of the so-called Palazzo delle Torri, or Porta Palatina, the ancient Porta Principalis Sinistra of Roman Turin, which was also turned into a fortress in the Middle Ages. On its outer face this colossal gateway, with its high sixteen-sided towers and double-arched gallery, is the only one of the four to remain in almost perfect preservation, so perfect that its Augustan date was not until quite recently admitted. Since 1905 it has been in process of restoration—the mediæval battlements removed, the windows and galleries opened up, the ancient level, two metres below the street, laid bare, and the later constructions attached to the face removed. If the ancient foundations and walls in the rear should be wholly uncovered—which the Government has not yet provided the funds to do—the plan of the fortress-like structure would be evident. Already we may conjecture it to be similar to the well-preserved Augustan gate at Nîmes, which also has four openings and a central court, though the Turin gate is on a larger scale, for its width with the towers exceeds 100 feet (36 metres).

The two other city gates have disappeared, but they have been located and part of their foundations has been found. That on the south was called in the Middle Ages Porta Marmorea, perhaps owing to the marble facing that originally covered the lower part of the brickwork of these gates, but may have long previously been torn away from the others.

On none of them, however, was there any place for sculptured decoration in relief, so that I was led to attribute to some destroyed arch the sculptured frieze of arms and armor and the bit of a military scene now in the Museum, as well as the similar fine fragment of a prætorian soldier and horse in the Office of the Direzione! I am much tempted to resurrect for the purpose the Colony Arch of the Augustan Turin, which must have stood a short distance outside the principal city gate (Porta Prætoria), across the approach by the military road. I may be permitted to refer to the theory which I laid before the recent Archæological Congress at Athens, and which French archæologists seem to have since tested and found true of their numerous African arches, that when a Roman colony or municipality was founded, it was the general custom to build an arch across the main approach, on the sacred boundary line or *pomerium*. This arch usually received an inscription stating the name of the city, its municipal status, the time and sometimes the circumstances of its foundation. It was, in fact, the monumental emblem of the city, and marked it as part of the Roman domain. It corresponded to the triumphal arches in Rome.

We find such colony or municipal arches in the other Augustan cities of this northern and Alpine region, at Verona, Aosta, and Susa. It certainly must have existed at Turin. Where did it stand? At Aosta it it was placed 366 yards outside the city gate, and as the Roman Turin was of exactly the same length (2440 ft.) as Aosta, we may place its arch at about the same distance in front of the walls, probably outside of the gate under the Palazzo Madama. I have suggested to the Turin Office to look for its foundations near the line of the present Via della Zecca. The frieze of arms and armor which I attribute to it are of a type quite similar to that on the Colony Arch at Pola in Istria, and to that on the Colony Arch of St. Rémy in southern France, both of which belong to the early part of the reign of Augustus, undoubtedly also the date of Turin and its arch.

How can we venture to date the foundation of Turin so exactly? The form of its official title gives the clue: "Colonia Julia Augusta Taurinorum." It is clear that the colonies founded in the time of Julius Cæsar, say in Gaul, had been called "Colonia Julia Paterna." After his death (44 B. C.), the colonies founded by the triumvirs (43-30), who kept his memory green, were called simply "Colonia Julia." Then, when Augustus had in 27 B. C. frankly established an imperial constitution, he began to call all the new colonies founded by himself after his own name, "Colonia Augusta." But there were three years, from 29 to 27, during which he may have prepared the way by combining the two ascriptions Julia and Augusta, and to this category Turin belongs. This explanation seems more probable than the one which would make Cæsar its first and Augustus its second founder.

But are there historic reasons for placing Turin so much earlier in the reign of Augustus than is commonly thought? I believe there are. The explanation is the more interesting as it involves the entire scheme of Augustus for the combined defence of Italy from northern invasion, and for the invasion and conquest of northern Europe, by opening up the roads across the Alps. We know that, curiously enough, while Rome was conquering the world she was by no means safe in her own peninsula. The entire arc of the Alpine ranges from the Riviera to the crest of the Adriatic was still in the possession of unsubdued warlike tribes, and all the great Alpine passes were open to invaders from northern Europe, who could descend into the plains of Piedmont, Lombardy, and Venetia. Settled and advanced culture was impossible where freebooters had full sway. Worse yet, military communications with Gaul and Germany were insecure except in case of a large force, and depended on the friendship of local chieftains, such as that of Donnus, King of the Cottian Alps, whose friendship for Julius Cæsar had made the passage to Gaul across the Mont Genèvre possible.

As soon as Augustus had restored normal conditions, after the defeat and death of Marc Antony, and had become sole master of the Roman world, he planned to put an end to this intolerable condition, and at the same time to create a base for the conquest of Germany and the Danubian lands, so as to make of the River Danube the northern boundary of the empire, a plan which he was soon to entrust to the generals of his family, Drusus and Tiberius. For this he needed to control all the Alpine passes; and it is the details of this scheme, and the monuments that still record it, that I have been studying at Turin and all along the line. How successful it finally was, after years of minute, inglorious, and wearing strategy, far more difficult than that of the Boer war, is commemorated in the famous Augustan Trophy, which the French are finally laying bare at the present moment, at La Turbie, near Nice. This towering pile, overlooking the main Roman causeway which leads along the Riviera to Gaul and Spain, gives the names of forty-six Alpine tribes, from Mediterranean to Adriatic, whom Augustus had conquered. It was built in 7-6 B. C., after the last insurrection had been quenched.

I believe that the general plan of Augustus, which was carried out mainly during the fourteen years between 28 and 15 B. C., was to establish separate groups of two fortified cities in connection with each of the main Alpine passes: a smaller city at the head of the narrow valley that led to the pass on the Italian side; and a larger city opposite the lower end of this valley, where it opened out into the great Italian plain. Not until 15 B. C. did the Augustan troops, under Drusus, begin to occupy the slopes and valleys beyond the passes. Setting aside for the moment the insignificant passages of the Maritime Alps, the first great passes as one moves from west to east along the Alpine range are those over the Mt. Genèvre and the Mt. Cenis. Toward them a single road ascends from the Italian plain along the narrow valley through which the Dora Riparia flows until it reaches the site of Susa. At this point it forks: the left road passes over the Mt. Genèvre through what was the most important of the passes in Republican times, while the right road traverses the Mt. Cenis. As Susa commanded both, it was very strongly fortified, and was called Italiæ Claustrum. Politically speaking, its condition was anomalous, and was expressed by what I shall call the Colony Arch of Susa, though Susa was not a colony, but the chief city of a federation of tribes who were allowed considerable autonomy under Cottius, the son of Donnus, Cæsar's friend, who was at the same time king of these tribes, and their governor (prefect) on behalf of Rome. This federation, to which Roman municipal rights were conceded, was unique among the whole galaxy of Alpine tribes in its friendship for Rome, the only group not conquered by force of arms; and its recompense for willingness to enter into the Roman scheme was this recognition of autonomy, resembling, but somewhat more real than, the treatment by which the English perpetuated in India some of the native principalities. The scene enacted, when at a solemn sacrifice these tribes took the oath of fealty to Rome and Augustus, is represented on the frieze of the Arch of Susa, and its inscription enumerates the tribes that formed the confederacy. To their chieftain, Julius Cottius, the Emperor entrusted the building and policing of the great pass-roads, and the entire region was named, after him, the Cottian Alps.

Susa, therefore, was the Roman bulwark at the head of the valley. If we then pass down the old highway a distance of forty miles we reach the point where the Dora Riparia runs into the Po. Here, at the entrance of the great plain, we find the second unit in the duet, Turin, Colonia Julia Augusta Taurinorum, a great bulwark in case by any chance Susa should have been captured or boxed up; and also a base of supplies and military camp, colonized by veterans, from the legions disbanded when the close of the civil war made a reduction in the army necessary. The close relations between the two cities—Susa and Turin—at the beginning of their history, were proved very recently by the discovery in Turin of part of a large inscription from some public monument of the Augustan Turin, actually dedicated by Cottius himself, the prefect-king of the Cottian Alps. Turin itself, as usual, had not been created *ab ovo* by the Romans. Their colony was established at the point where an original station of the native Taurini had existed, for it was a self-indicated site, at the intersection of two rivers, on the great northern trade thoroughfare from east to west, between the two seas, and the national centre of the west section of the Po valley.

The plan of the Roman colony was almost exactly the "classic" norm of camp and city given by the well-known gnomatic writer Hyginus. He describes the ideal plan as 2,400 feet long and two-thirds of this (1,600 feet) wide. Any greater length, he said, endangered defensive operations, as signals and alarms could not be as distinctly heard. Turin fulfils exactly the length measurement and if its width was greater than the

normal (2,220 feet in place of 1,600 feet), this was not important; it was only here that it surpassed Aosta in size. Apparently the city fluctuated but little in the course of imperial history, and we may conjecture that its time of greatest importance was under its founder, Augustus, and before the surge of the Roman advance had passed permanently northward. Together with Susa it guarded the main commercial road to Arles (Arelate) and the rest of the *Provincia* of Southern Gaul (Provence).

This was but the westernmost unit in the scheme of Augustus for defensive and offensive operations in the north. The next, both geographically and historically, is the group Aosta (Augusta Prætoria)—Ivrea (Eporedia).

A. L. FROTHINGHAM.

NEWS FOR BIBLIOPHILES.

In the *Nation* of last week there was a letter from William E. A. Axon, describing a copy of Henry Ainsworth's "Arrow against Idolatry," with its anomalous imprint, "Nova Belgia, Printed 1640." Mr. Axon was able to trace two copies only, his own and one in the British Museum, and hazarded the suggestion that the book might have been printed in New York, the name Nova Belgia (or more commonly Novum Belgicum) having been frequently applied to the Colony of New Netherlands by contemporary geographers. A third copy of the book is before us, and, if the printing of any book in English in New Amsterdam in 1640 were a possible supposition, the superiority of the typography to that of the early productions of the Massachusetts or New York presses would be evidence enough to disprove it. Watt in his "Bibliotheca Britannica" gives the "Arrow against Idolators" in his list of Ainsworth's writings, but gives the place and date as "London, 1640," where, as a matter of fact, the book was probably printed. To put "Printed at Amsterdam" on the title-page of a book was a not uncommon custom where author or printer for one or another reason wished to hide the actual place of publication of any book. Following this ancient custom the title-page of "An Object of Pity," that amusing skit by R. L. Stevenson and his friends, bears the words "Printed at Amsterdam," though the book was actually printed in Sydney, New South Wales. Ainsworth died in 1622, and whoever published this "Arrow against Idolatry," not caring to give the actual place of printing and having reasons perhaps for not naming Amsterdam (Ainsworth having resided there for many years) took instead that distant colony Novum Belgicum.

The Grolier Club Year Book for 1907 has just been distributed to members. A list of books and articles in magazines, etc., relating to bookbinding, and which are to be found in the club library, fills, with its index, nearly seventy pages, and is a welcome addition to the reports, list of members, etc., usually found in such year books.

On June 3, afternoon and evening, the Anderson Auction Company sells an interesting collection of books. Most notable, perhaps, is a series of works on Mexico and Peru, including: Boturini's "Idea de una nueva Historia General de la America Septentrional," 1746; Gomara's "Historia de Mexico," 1554; Sahagun's "Historia General de las Cosas de Nueva España," 1829-30; Villa-Senor's "Theatro Americano," 1746-48; Garcilaso de la Vega's "Commentarios Reales," 1722; Torres-Rubio's "Arte y Vocabulario de la Lengua Quichua," 1754; Juan y Illoa's "Viage a la America Meridional," 1748, large paper copy, etc.

On the same day the Merwin-Clayton Sales Company sells a private collection of book-plates, 462 lots, about one-half being American. On June 4 they sell a collection, including miscellaneous Americana, books on John Brown, Harper's Ferry, and Kansas; Confederate imprints; books relating to the American Indians; a few first editions of Bliss Carman, Andrew Lang, N. P. Willis, etc. On June 6 they sell the autograph collection of William R. Weeks of Newark, N. J., 313 lots, mostly American, and including a large number of documents of unusual importance and interest. An original survey by Washington of a plot of land in Frederick County, Virginia, dated April 21, 1750; a petition addressed to Washington, signed by thirty officers at West Point, dated June 21, 1784; several fine letters of John Quincy Adams; four A. L. S. of Benedict Arnold, one dated from Ticonderoga, July 6, 1775. There are also letters of Longfellow, Kipling, Mark Twain, and many others.

Correspondence.

THE AMERICAN FISHERY QUESTION IN NEWFOUNDLAND.

TO THE EDITOR OF THE NATION:

SIR: It is somewhat singular that a small colony like Newfoundland should be associated with some of the most important judgments of the Privy Council on colonial law. The decision of Baron Parke in the great case of Kielly vs. Carson, settled forever the status of colonial and statutable parliaments, their rights, privileges, and limitations. Baird vs. Walker defined the operation of a *modus vivendi*.—that it was not an "act of state" and did not control the common law rights of a subject. The present decision of the Newfoundland Supreme Court in the case of the two fishermen who were convicted before the magistrate in Bay of Islands for selling herrings to an American schooner contrary to the provisions of the local law known as the "Bait Act," goes one step further than Baird vs. Walker, and decides that a *modus vivendi* does not operate over a colonial statute that has received the Royal assent and become law.

The judgments of both the chief justice and his assistant, so far as made public, do not distinctly grapple with the *modus vivendi*. It is only by implication that their decision really amounts to a clear judgment that the *modus vivendi* has no effect over the local statute. The defendants contended, first, that they formed part of the crew of the American schooner, and a commission was issued to take evidence in Boston as to their regular engagement as seamen according to the laws of the United States. It turned out that the only formality was that the mate took down the names of the Newfoundland fishermen whom he engaged to catch herrings for him. So according to American law they did not form part of the vessel's crew, not being legally shipped. The Convention of Ghent gave the fishing privileges to "inhabitants of the United States." No one could transmogrify these Newfoundland fishermen into such inhabitants. The *modus vivendi* provided "that the shipment of Newfoundlanders by American fishermen outside the three-mile limit is not made the basis of international interference, or to be penalized."

In reading this arrangement we are struck with the arrogance and ignorance of its framers. In Star Chamber fashion two officials by a stroke of the pen calmly proceed to destroy the sovereign rights of a colony, and to declare that its laws shall be a dead letter. A rudimentary knowledge of law would show them that the fishermen engaged outside the three-mile limit would be amenable to the local laws as soon as they returned to port and came under the colonial jurisdiction.

The important part of the Supreme Court judgment is the decision that the engagement of these Newfoundlanders by an American is wholly void and illegal, being contrary to the express words of the act of 1905, which forbids the local fishermen to engage or serve aboard American vessels in the herring fishery at Bay of Islands. The judgment goes on to declare that the selling and putting aboard of herrings by the defendants was a breach of the local law known as the "Bait Act"; that they were rightly convicted by the magistrate, and his judgment is sustained.

The grave character of this judicial pronouncement is obvious. In effect it declares that the provision in the *modus vivendi* to ship the local fishermen outside the three miles is a subterfuge, a fraud, and a clear violation of law, utterly void and of no effect. The English public have a sensible dread of anything immoral, but they have a holy horror of illegality. The whole proceeding is, to use Talleyrand's immortal phrase, worse than a crime, it is a blunder, and an exceptionally stupid blunder. Winston Churchill declared that if the *modus vivendi* had not been agreed to, we were exposed to great international danger. Our good relations with America would be most seriously endangered. The consummate audacity of this assertion is simply splendid mendacity. The whole object of the arrangement was to serve Lodge's smugglers to get cheap labor from the natives, and thus enable them to make a big profit on their smuggled herrings, caught by Newfoundlanders, paid for in American gold, but passed through the United States custom house "*as the sole product of American industry.*"

What confidence the bold Churchill must have had in the supreme ignorance of his hearers when he dared to say that America would be angry, almost ready to declare war for the sake of Lodge's smugglers! Every one knows the contrary, that all intelligent sentiment in America is in favor of Newfoundland and free cheap fish.

There is one other point about the judgment—who is going to pay the costs? Is the Gloucester Ring or the American Government supporting the defendants' case? No expense is spared, and the appeal to the English Privy Council will cost some thousands of dollars. Who is going to pay the piper?

The terms of the *modus vivendi* seem intended for an undertaking and guarantee that Americans shipping natives are not to suffer, "nor to be penalized." Here is a case in which the men so shipping are penalized. No one seems to know who is finding the money for the defence. It is, however, generally believed here that it is furnished from the American Treasury, and in that case, England will, under the terms of the *modus vivendi*, be bound to reimburse Washington. How pleased John Bull and the British taxpayer will be to pay up for Bannerman blunders and Lord Elgin's illegalities!

My readers will naturally ask the question, What is a *modus vivendi*? It is an arrangement unknown to the law. It is not an act of state; it is not an act of Parliament, nor is it a treaty. It is wanting in all the formalities and essentials of these agreements. It is simply a diplomatic arrangement; a temporary provision, binding in honor on both parties, but without any legal effect. I feel convinced that Sir Mortimer Durand, the British ambassador, well versed in American politics, foresaw the effect of the diplomatic muddle, realized that it would embitter colonial feeling, and like a wise man hopped out of the embroglio.

D. W. Prowse.

St. John's, Newfoundland, May 10.

CRIMINAL LAW REFORM.

To the Editor of The Nation:

Sir: In your recent article entitled "Criminal Law Reform," you ask, "Are American lawyers going to do nothing to make such a reproach to American jurisprudence as the conduct of the Thaw trial hereafter impossible?" If I may venture an answer to this question, it will be "Yes; in all probability that is precisely what they are going to do; just nothing"—and this notwithstanding the crying need of a remedy. The reasons are various, but they may be effectually summed up in two words, viz., "Commercialism" and "Conservatism."

The commercialism which now pervades American society at large pervades also the legal profession and largely determines its character. American lawyers may be roughly divided into two classes, one of which is struggling for wealth and the other of which is struggling for existence; and each class is so absorbed as to have little time and no inclination for the cultivation of legal science or plans for social betterment.

From the very nature of its calling the legal profession is intensely conservative. Its primary function is to administer rather than to make the laws—to deal with the law as it is, rather than as it ought to be—leaving it to the law-maker to determine the latter. Moreover, it realizes more vividly than any other class that changes are always dangerous, because the entire framework of society is supported by an intricate network of laws which are so intimately interwoven that any radical change is likely to work harm rather than good. In all progressive countries the law must be constantly changing, because conditions are constantly changing. These changes would naturally be made by legislation, but in common-law countries like our own they are made for the most part indirectly by judicial decisions. Through long and devoted adherence to this method of adjusting laws to social needs we have strengthened and confirmed the habit of its use, and at the same time caused the legislative method to be neglected.

In view of these conditions it seems a safe prediction to say that American lawyers will not undertake the task which you mention, and it is doubtful whether they could accomplish much if they should undertake it. The particular evils which you desire to see reformed are intimately interwoven with our system of trial by jury. The underlying cause of what was most objectionable in the Thaw trial was the fact that within certain limitations the power of the jury is practically absolute and above the law. Although in theory and by their oaths bound to render a verdict according to law, the jury may, and not infrequently do, render verdicts according to their own feelings and in violation of law. The simple fact is that the right of trial by jury is not only the right of an innocent man to a fair and impartial trial by his peers, but also the right of a guilty man to a verdict of acquittal contrary to law if he can induce the "twelve good men and true" to grant him that favor. This may seem absurd, but it is nevertheless true.

The situation may be briefly summed up by saying that in some of its essential features our system of trial by jury has become an anachronism, and that the work of revising it to meet changed conditions without destroying it, is one of the most important and difficult problems that we now have to face. It requires the co-operation not only of lawyers, but of intelligent and public-spirited citizens of all classes. It is by no means so simple a matter as is assumed by the writer in the *Solicitors Journal* (London). He evidently considers that it is merely a matter of judicial discretion on the part of the trial judge, and asserts that "the weakest English judge" could have so conducted the Thaw trial as to eliminate all the objectionable features. Possibly a trial judge might do that with impunity in countries where there is no criminal appeal; but if he undertook to do it in this country he would be very likely to find himself presently retrying the case with some sharp reminder from the Appellate Court that his function is to administer the law as it is, and to refrain from assuming the rôle of law-maker for the particular case on trial.

Herbert L. Baker.

Detroit, May 14.

THE VOTE OF SENATOR ROSS.

To the Editor of The Nation:

Sir: The recent death at Albuquerque, New Mexico, of ex-Senator Edmund G. Ross makes it appropriate to print the first note that Mr. Ross wrote to his wife after his vote for the acquittal of President Johnson. The note is in the possession of Mrs. George Leis of Lawrence, Kan., who is a daughter of Mr. Ross. Mrs. Leis allowed me to copy it some months ago, but only now consents to its publication. It is written upon a half sheet of Senate stationery, is dated "22d," meaning the 22d of May, 1868, and reads as follows:

Don't be discouraged, dear wife, it's all coming out right. This storm of passion will soon pass away and then the people, the whole people will thank and bless me for having saved the country by my single vote from the greatest peril through which it has ever passed, though none but God can ever know the struggle it has cost me. Millions of men are cursing me to-day, but they will bless me to-morrow. But few knew of the precipice upon which we all stood on Saturday morning last. Your aff. Hus.

I am accustomed to think of Senator Ross's vote in the Johnson trial as the most heroic act in American history, incomparably more difficult than any deed of valor upon the field of battle. But why, it may be asked, was Ross's vote more heroic than that of the other six Republicans, who also voted for acquittal? There would seem to be some difference, chiefly for two reasons. The other men, especially Fessenden, Grimes, and Trumbull, had been longer in public life, were more accustomed to its storm and stress, and better able to withstand its pressure. Second and more important, the pressure brought to bear upon Mr. Ross was vastly greater than upon the other men. His constituency was the most radical of all, and it was believed to the last that he could be intimidated. He, therefore, cast his vote in the face of the greatest difficulties. No man was ever more foully abused, yet he bore personal abuse and retirement to private life alike with patience and without bitterness. If the people of Kansas wish to atone for the injury they did to Mr. Ross during his lifetime, they can scarcely do better than place his statue in the Capitol at Washington in the hall reserved for statues of notable men of the several States. Such a statue would commemorate an heroic act, a valiant soldier, and an honest man.

University of Kansas, May 13.

PHOTOGRAPHS OF THE "AGAMEMNON" PERFORMANCE.

To the Editor of The Nation:

Sir: I shall be glad if I may use your columns to answer many inquiries in regard to photographs of the performance of the "Agamemnon" of Æschylus in the Stadium last June. They may still be had by applying to Dr. C. N. Jackson, Beck Hall, Cambridge. Your readers will be glad to know that the music to the play, written by John Ellerton Lodge, has just been published by C. W. Thompson & Company of Boston.

W. F. Harris.

Cambridge, May 23.

PICTURES BY JOHN THOMSON OF DUDDINGTON.

To the Editor of The Nation:

Sir: Will you permit me to make an appeal through your columns to any one resident in the United States fortunate enough to be in possession of pictures by John Thomson of Duddington, the Scottish landscape painter. I am compiling a catalogue of all the known works of the artist to form an appendix to a critical and biographical survey of his career, and would, therefore, feel very grateful for information in regard to works of his in America.

Possessors of pictures communicating with me, might kindly do so without delay, giving a full description of each picture, with size and transcription of any writing on back of either canvas or frame, and any further particulars it may be in their power to give. R. W. NAPIER.

Edinburgh, 26 Bruntsfield Place, May 16.

Notes.

The Macmillan Company this week publishes the tenth volume of "The Cambridge Modern History." It is called "The Restoration," and is divided into twenty-four sections.

G. F. Abbott has finished his work on "Israel in Europe," and Macmillans expect to have it ready next month.

John Murray is to publish a selection from the letters and papers of Gladstone on matters ecclesiastical and theological. The editorial work together with the preparation of the explanatory narrative has been entrusted to D. C. Lathbury.

Funk & Wagnalls Company will issue a curious story called "Magda, Queen of Sheba," taken from the Gbese. the language of the Etbiopian priests. The English translation is by Mrs. John Van Vorst and is made from the French version of Hugbes Le Roux. This strange history of Solomon and the Queen of Sheba and their son has never before been fully translated into any European language.

It is announced that the official memoir of Tbomas Bailey Aldrich is to be prepared by Ferris Greenslet. The owners of letters from Mr. Aldrich, of general or characteristic interest, are requested to send them to Mr. Greenslet, at No. 4 Park Street, Boston.

A ninth edition, revised and enlarged, of Dr. S. D. McConnell's "History of the American Episcopal Church" has been issued by Tbomas Whittaker.

A seasonable little book for the month of commencement exercises is Jennette E. C. Lincoln's "May-Pole Possibilities; with Dances and Drills for Modern Pastime" (American Gymnasia Co.).

Tbe Oxford University Press publishes "A Handbook of tbe Ila Language," by Edwin W. Smith of the Baila Batonga Mission. Ila is the speech of tbe Baila, or Mashukulumbwe, wbo live in Northwest Rhodesia. Tbe Baila themselves number about 25,000 only, but tbeir language is used by several of the neighboring tribes.

A volume of *pages choisies* from the "Caractères" of La Bruyère has been added to tbe Dent-Putnam series of Classiques Français. Tbe Preface is by Augustin Filon.

Alphonse Lemerre issues tbe fifth volume of Mme. Adam's "Mémoires," called "Mes angoisses et nos luttes, 1871-1873." Hachette publishes a complete edition of Alfred de Musset in ten volumes with notes by Edmond Biré, and tbe fourth and last volume of "H. Taine, sa vie et sa correspondance, 1876-1893." Sansot will soon have ready Alphonse Séché's "Alfred de Musset anecdotique."

An interesting pamphlet has been issued by the New Bedford Public Library, relating to its collection of books, pamphlets, log-books, prints, and other articles illustrating the whale fishery. The position of New Bedford in respect to tbis old industry is unique, and this attempt to bring together what material can be collected descriptive of a dying industry, is worthy of praise. In the fine building of tbe Historical Society, in tbat city, there are numerous excellent specimens of boats and implements once used, and in connection with the library documents, these will afford an almost complete picture of one important pbase of tbe old days. Among the documents is a quaint woodcut from the early eighteenth century, showing Jonah just thrown upon a rocky sbore, the wbale lingering near, in manifest curiosity. Books and pamphlets relating to tbe subject are classified as those dealing with the whale alone, "whale fishery," "incidental references to whaling," "articles in periodical literature," "whaling fiction," and "log-books." Mr. George H. Tripp, librarian, writes that "tbe library is desirous of obtaining, by gift or purchase, any additional material pertaining to the subject of whale fishing."

Another magazine for the few, *Orkney and Shetland Old-law*, bas now reacbed a second number. It is put out by the Viking Club, founded in 1892 for the study of the antiquities and literature of the North. Each quarterly is to consist of (i) a miscellany of notes and queries on genealogies in Orkney and Shetland, their folklore, arcbæology, natural history, etc.; (ii) a diplomatarium, records relating to tbem, or else of special works., *i. e.*, translations, articles on place-names, reprints of rare tracts, legal documents, etc. Next to the Shetland Sasines, tbe most interesting items in the present volume are "The Authorship of the Orkneying Saga" (Yarla Sögur), by Yón Stefánsson, and a legend of Shetland from Fljótsdæla Saga, by W. G. Collingwood. Besides this magazine, which may be had for 10s. 6d. a year from Mr. A. Sbaw Mellor (No. 14 Westbourne Street, Hyde Park, London, W.), the club publisbes "The Saga Book," a yearly volume of proceedings, with contributions from scbolars of all nations, a special series of translations, and a certain number of other works.

Tbe Reale Deputazione di Storia Patria per le antiche Province e la Lombardia (Royal Society of National History for the original Provinces [Piedmont] and Lombardy), wbose publications, "Historiæ Patriæ Monumenta," "Miscellanea di Storia Italiana," and "Biblioteca Storica Italiana," rank among the most scholarly collections edited by European historical societies, has initiated an additional series, Biblioteca di Storia Italiana Recente, 1800-1850 (Library of Modern Italian History). Until now the royal historical societies of the different parts of Italy, excepting that of Sicily, have occupied tbemselves almost exclusively with mediæval and classical studies, partly from fear that political passions and traditional family jealousies migbt disturb tbe serenity of historical criticism in the treatment of later events, but partly also from a failure to appreciate tbe importance of Italian history of the nineteenth century in tbe development of European nationalities and in the establishment of tbe principles of constitutional liberty. The first volume of tbe new publication consists of two studies of primary importance, "Aneddoti documentati sulla censura in Piemonte dalla restaurazione alla costituzione," by Antonio Manno, and "Alcuni episodi del risorgimento italiano illustrati con lettere e memorie inedite del Generale Marcbese Carlo Emanuele Ferrero Della Marmora, Principe di Masserano," by Mario degli Alberti.

Tbe censorsbip of tbe press is a subject upon which little research bas hitherto been carried on, and one which is calculated to contribute vital and positive evidence upon the undeclared principles and inner sentiments of the fallen despotic governments. Manno's work, which covers the period of 1815-1848, is but a chapter of tbe comprebensive studies upon Piedmont, which he has been pursuing for a long period of years in tbe state archives of Turin as well as in the archives of many private families. He bas brought together a mass of specific facts and episodes, arranged under various headings—political precautions, religious precautions, regard for foreign susceptibilities, favors, penalties, tbeatrical representations, newspapers, scientific congresses, etc.—forming in tbe aggregate a substantially complete record of the character of press restrictions in Piedmont during tbe period. Among the documents given in full are twenty-four unpublished letters of Vincent Gioberti, 1842-1847.

The work of Degli Alberti consists almost exclusively of letters and diaries of the general, who made the campaign of 1848 against Austria as major-general on the general staff of Carlo Alberto, and tbe brief campaign of 1849 against tbe same traditional enemy as bis first aide-de-camp. Tbe body of the work consists of one hundred and two letters of the general addressed to his wife, March 27-October 19, 1848, supplemented by extracts from his diaries added in foot-notes. Tbe intimate character of the documents and the peculiar opportunities for observing events enjoyed by their author, lend unusual value to their reflection of the opinions and sentiments prevailing at Piedmontese headquarters during the campaign, and to their account of such events as the tragic episode at Palazzo Greppi in Milan, of which Della Marmora was an eye-witness. Appendixes contain letters and diaries relating to his mission to Spain, March-April, 1849, to obtain confirmation of Carlo Alberto's verbal abdication given at Novara; and to his mission to tbe same country, August-October, 1849, to accompany the remains of the dead king on their journey back to Piedmont. Several typographical errors of dates are to be noted in Degli Alberti's work.

The University Library of Tübingen has recently come into possession of a valuable collection of Armenian manuscripts and publications. The catalogue reports in full on 110 manuscripts. Tbe most important number is doubtless a New Testament parchment containing tbe gospels, which is a good copy of a manuscript dating back to 839 A. D. So rich are these documents in miniatures and other ornamental features tbat a special atlas of them is being prepared, reproducing on six sheets twenty-four specimens.

The religious communities among the early German settlers in America have received scant notice by historians of American religious life. That these humble folk were not without influence, and contributed not a little to the worth of our national character, is shown by Lucy Forney Bittinger in her "German Religious Life in Colonial Times" (Philadelphia: J. B. Lippincott Co.). The author has made extensive use of local histories and obscure publications, and has brought the life of these small sects and communities into relation with larger movements both in Germany and America. Her work shows much care and pains, and full sympathy with its subject.

The celebration in Germany of the three hundredth anniversary of the birth of Paul Gerhardt (born in Grafenhainichen, Saxony, March 12, 1607) has called forth a large number of publications on the life and work of the great Lutheran hymn writer. Festival orations characterized by exaggerated praise, and sketches for popular celebrations, with music and declamations, have appeared in quantity, but serious critical studies of Gerhardt's work are not wanting. Perhaps the best is the essay of Paul Wernle, the Basel theologian ("Paulus Gerhardt." Tübingen: Mohr). Wernle is at pains to exhibit the background of Gerhardt's life in the fierce theological contests between the Lutherans and the Calvinists, and his estimate of the poet shows a fine sense for the merits as well as for the limitations of his religious poetry. Another historian of ability who has turned his attention to Gerhardt is Hermann Petrich, whose "Gerhardt-Buch" (Güterslow: Bertelsmann) reveals æsthetic appreciation as well as historical thoroughness. An address by Prof. Gustav Kawerau of Breslau (Halle: R. Haupt) is also worthy of mention. Of special excellence is an illustrated edition of Gerhardt's 130 German poems, with drawings by Rudolf Schäfer (Hamburg: Gustav Schloessmann). Gerhardt as a theologian was narrow and uninteresting, but Christianity as the religion of sorrow has seldom found more beautiful expression than in his "O Haupt voll Blut und Wunden," and the faith of the pious soul has scarcely had fuller revelation than in the hymns "Befiehl du deine Wege," "Gieb dich zufrieden," and "Ist Gott für mich, so trete."

"French Romanticism and the Press," by T. R. Davies (Cambridge University Press), discusses one of the manifold factors in the determination of the famous literary epoch. The inquiry is here narrowed down to the rôle attributable to *Le Globe* (1824-1832), which, by encouraging critical independence in its contributors, contrasted with the usual policy of a settled platform and a programme of literary dogmas. Sainte-Beuve, it is true, judged *Le Globe* differently. Mr. Davies's contention proceeds with an initial sketch of the history of the Romantic Tendency (not altogether free from question-begging), and elaborates his thesis with extracts from the newspaper which illustrate its diversities of judgment on contemporary poetry, criticism, fiction, etc. This method leads to occasional confusion, for the critic at times omits to emphasize the distinction between the newspaper's opinion and his own. As a collection of judgments the book is interesting and serviceable; but we fail to see exactly what weight of authority these views really exercised, for want of ample reference to *Le Globe's* circulation and influence.

Prof. Georg Jacob of Erlangen has added two new parts (6 and 7) to his "Türkische Bibliothek" (Berlin: Mayer & Müller), which are of high value for modern Turkish life. In one of them another "Month" is given from Mehmed Tevfiq's "Year in Constantinople," containing a short novel, mostly in dialogue, describing how two cousins who had known one another from infancy and who, for family reasons, had to marry one another, were dexterously brought to fall in love. It is a quite luminous little story of Turkish family life and affection of the old-fashioned kind. The other part gives three character sketches by Ahmed Hikmet of a much more modern type. He is plainly under Western influence, but uses simple Turkish motifs, reaching fundamental emotions. His old mother of three soldiers, all dead for the Faith, another younger mother with her one ailing child, a young wife, waiting in the strain of the fasting month for her husband's return after three years' absence, all stand out in most natural, simple pathos. The life in them is plainly Turkish and yet plainly modern.

In "Les Arabes en Syrie avant l'Islam" (Paris: Leroux), René Dussaud occupies himself principally with the semi-nomad people who left behind them what are known as the Safaite inscriptions, a group of graffiti in the Safā, a volcanic plain southeast of Damascus. With their manner of life, their dialect, pantheon, and final assimilation to the Syrian population he illustrates the way in which from time immemorial Arabia has disposed of her surplus inhabitants. They give occasion also, to discuss the architectural remains on the the Arabian-Syrian frontier and to find in them strong Persian influence, showing how the Arab kings of Hira had extended their rule and their type of art to the east of the Dead Sea, and had been recognized there by the Roman Empire as kings of all the Arabs. The Safaite alphabet also gives occasion to discuss the history of the alphabet in the broad and more particularly the relationship of the Sabæan-Minean characters to the Phœnician and the archaic Greek. M. Dussaud regards as almost certain the Greek origin of the South Arabian script and as most probable the Ægean origin of the alphabet in general His view, however, is obviously biassed by his attitude towards the Minean question which he begs by saying that if the Minean antiquity be conceded, they must have used the alphabet before it was invented (p. 74). But his book all over is most interesting and instructive, written with a light and artistic touch.

Prof. Pierre Arminjon of the Khedival Law School at Cairo has written a unique and most valuable book in his "L'Enseignement, la doctrine et la vie dans les universités musulmanes d'Égypte" (Paris: Felix Alcan). Few even professed Arabists have hitherto had any knowledge, either historical or practical, of the Muslim university system, and none has written upon it more than a few scattered notes. The present book, therefore, will be found full of information even by the professional student of Islam, while to the student of pedagogy it will open up a new field of the broadest. Professor Arminjon's style and method can be unhesitatingly commended, and his range of information and reading, both Arabic and European, his practical experience of the present situation, and his scholarship—in spite of some strange transliterations requiring divination in their re-renderer into Arabic—make him evidently a safe guide. He divides his material under six heads. First, the origin and vicissitudes of the Egyptian universities, especially the Azhar, which has now annexed all the others, down to the recent partial reform. Secondly, a very picturesque and full description of the Azhar and its extra-mural dependencies in the Delta. Thirdly, a similar description of the organization and life of the students, closing with two attractive little biographies, one of a student still there and the other of a blind professor. Fourthly, as Muslim learning has always been doctrine, a history of the development of that doctrine—legal, dogmatic, metaphysical, mystical—and of its relations to the schools is necessary and is given. This is the only really second-hand part of Professor Arminjon's treatment; Muslim theology and metaphysics are plainly not his ground. Yet he has seized and stated excellently the rôle of the schools in elaborating and fixing the still existent system. How a finished and changeless body of theological doctrine was reached, and philosophy became its scholastic handmaid, is made very clear. Fifthly, a statement of the actual programme and material of instruction: (i) what are reckoned as instrumental sciences—grammar, etymology, rhetoric, logic; and (ii) the final sciences, for which the others exist—dogmatics, religious ethics, canon law and its sources, exegesis of the Koran, prophetic traditions. Sixthly, the methods of teaching and learning, and the results of it all. Here the best is made of a pretty bad situation. But for all that, we are forced to feel the brave simplicity and iron diligence and earnestness that animate the whole. Some very useless things and a great deal of very fine character but absolutely no literature are cultivated on a very little oatmeal. On that point there are few teachers or students in this country but might profitably go to school at the Azhar, or at least read Professor Arminjon's book.

Mr. Ernest Gaskell has been at no small pains to make his "Oxfordshire Worthies" as comprehensive as possible. It includes biographies not only of the representatives of the great families of the district, the Churchills, the Fiennes, the Villiers, etc., and of the chief political leaders, but also of university dignitaries such as Doctor Edward Caird, and the Dean of Christ Church, and of civic and other notables belonging not only to Oxford, but to the neighboring divisions of Woodstock, Banbury, and Henley. The various notices are attractively written and will appeal to those who have a liking for British institutions, though some may be tempted to smile at the author's respect for tradition and his whole-hearted belief in the English aristocracy. It is only just to say that for all his hankering after Conservatism and "the old paths of constitutional reform and progress," he deals with

the Liberal leaders in a fair and impartial spirit. The book which contains numerous photographs has been published for private circulation (price three guineas), by the Greenhithe Printing Company, No. 10 Bread St. Hill, Queen Victoria Street, London, E. C.

Dr. Warren Washburn Florer of the University of Michigan, who some time ago prepared, with Ernst Wolf of St. Louis, a useful "Guide for the Study of Goethe's Hermann und Dorothea," has now completed a somewhat similar *Führer* for Goethe's "Egmont," (George Wahr, Ann Arbor). Dr. Florer is an enthusiastic advocate of the "direct method" of teaching German, and most of the book is made up of questions in German relating to specific scenes or to the story in general. There are also several pages of extracts in the original from Goethe's expressions concerning the drama, and a surprising amount of reflection and criticism they form. Simultaneously comes Dr. Florer's edition (Wahr) of Heyse's "L'Arrabbiata," made up after the direct method, and with a vocabulary having the nouns, strong and weak verbs, etc., separated.

It is probably true that honest volumes of sermons, by which we mean those that do not leave off the texts and pretend to be something else, are less in demand than formerly. Yet it were a pity if one could not run across, now and then, a book of gentle and persuasive homilies, like those of Dean Hodges of the Episcopal Theological School at Cambridge in "The Year of Grace," a collection of sermons appropriate to the chief Sundays and festivals of the Church year (Thomas Whittaker). The author has a sense for what is vital in piety, shows himself a keen observer of the tendencies of modern life, exhibits tact in the encouragement of spiritual living, and plies the lash on current foibles pleasantly, wisely, and to good effect.

Albert Harkness, professor emeritus of languages at Brown University, died on Monday, at Providence, R. I. He was born in Mendon, Mass., in 1822, was a graduate of Brown University, and soon after his graduation became a teacher in the Providence high school. Afterwards he studied in Germany, receiving the degree of Ph.D. at Bonn in 1845. On his return from Europe he was appointed professor of Greek language and literature at Brown University, and this connection remained unbroken until his death. Prof. Harkness was a founder of the American Philological Association, one of the organizers of the American School of Classical Studies at Athens, and a member of the Archæological Institute of America. He was the author of a large number of text-books which are extensively used. His first work —a new arrangement of "Arnold's First Latin Book"—was published in 1851, and since that time he had been constantly interested in the preparation of Latin texts and in studies referring to Latin grammar and composition.

A dispatch from Vienna announces the death of Dr. Emil Steinbach, first president of the Austrian Supreme Court and a member of the Upper House of the Reichsrath. He wrote on legal questions, and among his writings may be mentioned the following: "A Study of the Austrian Law," with special reference to sales, contracts, and the confirmation of criminal charges, 1877; "Rechtskentnisse des Publikums," 1878; "Grundsätze des heutigen Rechtes," 1888; "Der Staat und die moderne Privatmonopole," 1903.

MOLMENTI'S VENICE.

Venice: Its Individual Growth from the Earliest Beginnings to the Fall of the Republic. By Pompeo Molmenti; translated by Horatio F. Brown. Part I., The Middle Ages. 2 vols. Chicago: A. C. McClurg & Co. $5 net.

Signor Molmenti's history of Venice, as interpreted by the private life of the Venetians, appeared more than twenty-five years ago, was awarded a special prize by the Venetian Academy, took its place as an authority, and passed current in Europe in a French translation. It is remarkable, and hardly creditable, that so excellent a work should have waited so long for an English version; and yet the delay has brought its compensations, for during all this time Signor Molmenti has been adding to his knowledge of his subject, and to his book, which he has at last issued enriched in every way and trebled in bulk. Since 1880 much has been done in ransacking the details of Venetian history, so that Signor Molmenti is able to present the latest, and in many cases the definitive, statement. Moreover, the invention and perfecting of process engraving have made it possible for the publishers of this work to illustrate it profusely, at a cost which would not have been dreamed of earlier. And, though last, not least, Horatio Brown, himself *facile princeps* among living British knowers, lovers, and historians of Venice, has been secured to put Signor Molmenti's exuberant Italian into sound English prose.

There has been a marked increase in the attention paid of late to Venetian history, as is shown by the publication in recent years of several books on the subject. First came Horatio Brown's larger work in 1893. It is an excellent specimen of historical articulation: Mr. Brown takes every event and fits it into those which precede and follow, as the skilled anatomist sets up a skeleton, knuckle to knuckle, bone to bone. You feel, perhaps, that there is too much rigidity, and sometimes you would prefer fewer facts and more ideas, but, on the whole, you recognize Mr. Brown's trustworthiness and comprehensiveness. The little summary which he brought out a few years ago in the series of Temple Primers is a model of condensation, and, in spite of its brevity, it glows more than his larger history. Next came William C. Hazlitt's two massive volumes, which contain a vast amount of information—they constitute, indeed, a sort of encyclopædia of things Venetian—but are rather too ponderous in style, especially in the narrative portion. "The Oligarchy of Venice," which George B. McClellan, now mayor of New York, produced three years ago, would make a creditable college thesis, but it hardly has enduring value. Mr. McClellan seems to have chosen his subject in order to preach a sermon applicable to contemporary American politics, and he has no difficulty in finding that Venice offers an object lesson against Imperialism and that her oligarchy and the American political ring are at least first cousins. William R. Thayer, in his "Short History of Venice," emphasizes the wisdom of the oligarchy, the unrivalled political, social, and commercial adjustment of the Republic to its unique conditions, and he shows its relation from century to century to the great currents of Christian and Oriental development. Marion Crawford's "Salve Venetia," on the contrary, has little historic continuity, and less recognition of the interaction between Venice and the East and West, but abounds, as might be expected, in romantic material, in legends, picturesque historic episodes, and descriptions of manners and customs, written in Mr. Crawford's facile and popular manner. T. S. Okey's volume in the Mediæval Towns series hardly deserves serious consideration on the historic side, it being too evidently the product of a hasty compiler, who has in mind the needs of the hurried tourist. Perhaps Mrs. Oliphant's "Makers of Venice" ought also to be included in this list, but this book belongs, like Mr. Crawford's work, to romance rather than to history, and perpetuates so many false views and half-truths that one hesitates to recommend the volume to any reader who is not already well-grounded in the subject.

Signor Molmenti's "Venice," which is to be complete in six volumes, differs in purpose from all of these: for it treats the narration of events as of secondary importance, and magnifies the civilization. The very titles of the chapters indicate the general plan: "The Aspect and Form of the City," "The Constitution," "The Laws," "Commerce and Navigation," "Finance," "The Nobles and the Citizens"; these prepare one for a topical treatment, from which the historic sequence may, or may not, be inferred. Since Signor Molmenti deals with each topic so as to show its evolution, he leaves on one the impression of a serious historian, well trained in the scientific method. But he has what many who attempt works of this kind lack—charm, the gift of presenting a great body of material so that it not only conveys information, but gives pleasure. Take up any of his chapters, and you will read it through, notes and all, as you read the best of Horatio Brown's own essays in "Life on the Lagoons."

Of Signor Molmenti's conclusions on the disputed points in Venetian history we may take occasion to speak when we notice the succeeding volumes; for the present it must suffice us to say that his attitude is almost uniformly safe. A Venetian to the core, he does not imitate earlier native historians in claiming too much, especially during the formative centuries. Nor is he too positive in matters where there is very scanty evidence—a fault which we have observed in callow students of the subject. He has amassed in this first section the elements of Venetian civilization from the fifth century to the thirteenth, much as Burckhardt has done for the Italian Renaissance. Few concrete details have escaped him, but we note the absence of *dramatis personæ* in the drama. Probably the succeeding volumes, covering a period when salient personalities were numerous, may supply this lack. For after all, although Venice has been accused of swamping the individual, no one can read her story deeply without perceiving the deter-

mining influence which strong individuals, from Orscolo the Great to Morosini the Peloponnesian, exerted on her development.

More than passing notice should be made of the illustrations of this work. They are chosen wisely to illustrate every part of the text: here are views of buildings, maps, facsimiles of drawings, half-tones of paintings and sculptures, reproductions of illuminations, even pictures of playing cards. Mr. Brown gives a very readable paraphrase—not a literal translation of the Italian—as to which our only suggestion is that he should have translated the Italian and Latin phrases. A selection of original documents adds scholarly ballast, and reveals what sort of stiff material Signor Molmenti burrowed in before he wrote his flowing pages. His work should appeal with equal force to the general reader and to the specialist.

IMPRESSIONS OF AMERICA.

Amerikanische Eindrücke. Von Ludwig Fulda. Pp. 216. New York: G. Stechert & Co.

Two books on America have recently appeared in German: "Americana," by Karl Lamprecht, the distinguished jurist of the University of Leipzig (noticed in the *Nation* for August 2, 1906), and this unpretentious volume by Ludwig Fulda, the poet and novelist. This is an outgrowth of his tour last year while guest of the Germanistischen Gesellschaft von Amerika, when he delivered thirty-four lectures in twenty-four cities. The first bristles with savage thrusts at real or imaginary targets from one who quarrelled with the artistic finish of our coinage while en route to the New World, and who crawled out of bed *verkehrt* in the Western metropolis; the second is the sympathetic review of a witty and equally sharp-eyed critic, upon whom the friendly sun shone on the first day of his arrival in New York, and continued to shine, with rare exceptions, until his reluctant departure for Europe. Fulda came to America with a free and receptive mind, and yielded himself completely to whatever impressions his environment should make. We find him startled at seeing cab, passengers, and supposed ferry-house float off from New Jersey toward Manhattan, electrified when soaring aloft in an express elevator, lost in dreams amid the ribboned femininity of Vassar's lawn, touched to the heart by both American and German hospitality, and, like Dickens, dazed at the unlimited line of cuspidors in the State House of Ohio—"enough for a whole German province." All in all, Fulda condemns and compares little, while praising much; and where he does take issue, his criticism attracts, rather than repels. Without pretending to offer a thorough study of American institutions, or aiding us as Lamprecht did, perhaps, to see ourselves as we really are, Fulda has probably given us the most agreeable book on America written by a German for years.

Fulda finds New York surrounded by the mightiest local commerce of any city in the world, favored by natural beauty by day and *eine Abendschönheit* at night: "the spectacle that the Berliner gazes at with wonder on the Emperor's birthday, the New Yorker enjoys evening after evening." Her architectural attractions are less, and yet in the perspective of the Flatiron and other sky-scrapers, there are pleasing elements. These *Wolkenkratzer* appear in silhouette like blunt molars on the lower jaw of a leviathan, forming "a world by themselves," and "one could believe that giants had built here a city for giants." As to American cities in general, he questions whether it be true, as maintained, that when the traveller has seen one, he has seen all. There are common characteristics—more so than in Europe; but in area alone American cities exceed Old World towns. Business centres may be unattractive, city streets unclean, and park roads muddy; but each man aims to own a house for himself—a movement, Fulda might have added, that is under way in Germany; residence districts grow more and more beautiful, and such abuses as the monopoly of the water front at Chicago by the railways, toward which Lamprecht sent a fiery dart, will not always continue.

The best of American railroad cars are indubitably better than the best German cars; but the average car is not equal to the German second-class coupé, and only superior to the third class because of upholstery; the American sleeping-car, too, divided only by curtains, is inferior to the individual room of the German coach, now being introduced here. With Lamprecht, Fulda praises the magnificence of American hotels, wondering not a little at the telephone on the very dining-table; but he is miserable without his German *Nachttisch*, is perplexed without a bath thermometer, and stumbles about in the dark, reaching for the electric button, ten feet from the bed! Meals are disturbed by restaurant music—a wretched provision imported from Europe—rest and sleep made impossible by the overheating of cars and rooms. There is no rival in the New World to the German *Hausknecht;* hence if one puts one's boots out at night, it is only to offer them to a thief, or to find them the next morning *ungeputzt*. While Lamprecht bewails the lack of a perfunctory *Wirt* to say "Good-bye!" or ask about the weather, Fulda is glad to escape that senseless relic, and with it—in the West, at least—the necessity of giving fees.

That which most exceeds all expectations of the author, however, is the extent of popular education in America, and our systems of public and higher instruction. Every one here is hungry to learn, reading is more general than in any other country, and libraries surpass in number and practical organization, as well as sometimes in magnificent buildings, anything known abroad. "Every American, from millionaire to shoeblack, and from professor to schoolboy, is a fanatical newspaper reader," because of and notwithstanding the "horrible headlines." This fact may account for the importunate artists and women reporters, who more than once insisted on interviewing him at his morning toilet, "in the name of the newspaper, of course"; and for the piracy of foreign literature, calling for revision of the American copyright laws. Fulda observes with natural satisfaction the wide study of German by Americans. He attends classes and chapel, lectures and dines at colleges for women, and is delighted with the opportunity afforded the girls in America for advanced study, regarding their way of living and preparing for the duties of life superior to that of the average young woman in Germany dancing away her existence. He is inclined to believe that Schiller's exhortation, *Ehret die Frauen!* is observed by Germans rather in theory than in practice, more in words than in deeds. He prefers coeducation to the habit abroad of separating the sexes so long, praises the free relations between American professors and their students, and has a good word generally for student life among our young men, with their concerts and student plays. He feels a satisfaction in the absence of scarred and bloated faces, and holds that even the excesses of athletics are better than the duel and the *Mensur*. He finds no genuine American art, notwithstanding a popular artistic feeling, museums, and academies; and he thinks that individual, creative art is wanting because the American, alive to decorate his house, has not yet learned to adorn his life with art. Hard work, elaborate stage settings, and the fairest array of feminine beauty on any stage, characterize the American theatre; and yet the American has not perceived how great a force for good the theatre in right hands may become, and no American philanthropist has endowed the stage. In condemning the oft-repeated performance of the same play, Fulda errs in saying that Jefferson played the one rôle all his life.

Among the most interesting chapters in the volume is that entitled "Das Amerikanische Deutschtum," doubly interesting because Fulda comes to conclusions at direct variance with those of Lamprecht. He is astonished at the size and splendor of German clubhouses in New York, Chicago, and Indianapolis, outrivalling anything of the kind in Berlin or Vienna; he finds his fellow-countrymen patriotic, little desiring to establish a state within a state, and rich and poor alike preferring to stay here, labor and build, though suffering from constant *Heimweh!* Referring to Lamprecht's reproach that the German-Americans had never accomplished anything in public life, he attributes this fact largely to the power of sentiment, which induces the German to hold on to his mother-tongue, with the result that he is unable to master English oratory, demanded on the stump and in public life. Like Lamprecht, Fulda had the good fortune to meet Carl Schurz shortly before the statesman's death, and of him he says that he was the middle-point in a line drawn from Schiller to Bismarck; and that he was the greatest loss to the national stock of virility that followed the upheaval in 1848. Fulda's sense of humor is shown in his observation of the "broken German" of his fellow-countrymen; and his wit is evident in his narrative of visits to the Heine statue on the forlorn wastes of upper New York (to find which he spent a whole morning in an automobile), and to the statue of Frederick the Great, far on the outskirts of Washington, *wo die Füchse sich gute Nacht sagen!* In this isolation of the gift of the German Emperor, Fulda sees the natural disposition of the republican American to sidetrack the memorial of a monarch, no matter how great a man he may have been; but he asks, "Would a statue of Washington or Lincoln, sent to Berlin, fare better in its aspiration for a place in front of the royal palace or in the Siegesallee?"

More than once Fulda presents his conviction that America has still much to learn from Europe, according to the law that the young shall learn from the old; but his judgment is displayed in the single sentence: *Wehe dem Alter, das nicht auch von der Jugend lernen will.*

CURRENT FICTION.

The Veiled Lady and Other Men and Women. By F. Hopkinson Smith. New York: Charles Scribner's Sons.

The "staid old painter," as the author delights to call himself, is once more to the fore with a collection of stories whereof each one is the report of something he has either seen or heard. He brings constant assurance that our planet is full of everyday heroisms, that it is a place of kindliness and warmth, as well as of beauty and color. It is not the beautiful Veiled Lady who is his real achievement, but the conglomerate little dragoman who carries in his pocket enough of the small change of heroism to be a stanch friend in need. Courage, resource, and self-sacrifice are as common as humanity, and yet never lose their distinction any more than the least of human souls its individuality. "Captain Joe and the Susie Ann" is a perfect example of Hopkinson Smith's art in this phase of his sympathies. And another is "Against Orders," which contains a dog, and a choke for the reader. But derring-do is by no means the volume's only theme, nor even a deed with a coda of mischief. Sometimes it unfolds a bit of humor, like "The Coat of Red Lead," which is self-evidently an absolute portrait of the tropical revolutionist, his ways and means, and his convenient genius for turning swords into corkscrews. In "Sam Joplin's Epigastric Nerve" there seems to be a rift in the camaraderie we confidently expect, which in "Muggles's Supreme Moment" widens to the point of making the music temporarily mute. But in the whole group there is not one which does not show the wonted quick, even flow, the animation, the holding quality. And as ever, the end of the story comes with a decisive click, like a key in a lock, its note often merry, usually surprising, always musical.

The World's Warrant. By Norah Davis. Boston: Houghton, Mifflin & Co.

Miss Davis merits notice chiefly from her treating the South as a live country, inhabited by contemporary human beings, and not by a set of conventional lay figures left over from the tragedy of a past generation. True, she deals with Alabama and the new commercial South, and not with the retrospective society of Virginia and the Carolinas. A party of capitalists are booming a small Southwestern town. They bring their womenkind and everybody wears best clothes all the time. The negro question is entirely untouched, and the only reference to "Befo' the Wah" is rather satirical than serious. All this is full of promise, but then Miss Davis's first novel, "The Northerners," was also full of promise. She has imagination almost to excess, the kind of imagination which devises alarmingly intricate plots woven of courtship by letter, lost heirs, misleading pseudonyms, "deals," and mistaken identities. In the fine imagination which depends less upon vitality and the shock of event than upon a sense of probability she is entirely lacking. Nevertheless, in a certain swing and movement, a willingness to look out of her own eyes, and not her grandmother's, she continues to give proof of an undeniable talent. The question raised by "The Northerners," however, has not been answered by "The World's Warrant." Has she the self-critical power to prune her exuberance, to eschew florid language, to repent of "gowning" her beautiful young ladies, to live upon a Lenten allowance of adjectives?

The Invaders. By Margaret L. Woods. New York: Harper & Bros.

An extremely ingenious story of a dual personality, Mrs. Woods does not make the blunder of dragging in a scientific justification for her plot; but in the clever management of the hypnotic changes between a dull, conscientious college girl and a brilliant siren of no conscience whatever, there is evidence that the author has studied her Charcot to some purpose. The mechanical adjustment of Milly Flaxman and Mildred, Lady Hamerton, is so smoothly managed as to obliterate all likeness to a fairy tale and leave room for a series of exceedingly curious situations. Also Mrs. Woods thoroughly understands that in modern life, to ring true, any case of dual personality must needs be a serious matter. The Menæchmi may be comic, but many of us felt "The Masqueraders" to be rather distressing, and the case of a normal young Englishman who finds his wife alternately a perfectly uninteresting, worthy soul and an untrustworthy enchantress, is not fundamentally amusing. Mrs. Woods, so far from belittling her theme, pushes it on to a tragic conclusion. The good, affectionate wife awakes one morning to find herself in a strange house with a strange lover. This situation is treated with a dignity and feeling which almost place it in the rank of serious realistic fiction—almost, because the fact of being based upon so unlikely a contingency, necessarily interferes with the illusion. Nevertheless the minor characters are so carefully drawn, the general air of probability so maintained that Mrs. Woods has at least succeeded in writing a sufficiently readable novel.

An American Girl in India. By Shelland Bradley. New York: The Macmillan Co.

The American girl seems to be as fixed a type in the British mind as the English lord is in the American; and we suppose the manners and mode of speech attributed by the cousinly delineator are equally accurate on both sides of the dividing flood. The fact that the present narrative is simply a long monologue on the part of the alleged American girl rather forces the quality of her lingo upon the attention. It is sufficiently composite if not representative. She reckons and guesses with equal aplomb, and has certain idioms of her own invention, such as "I don't catch right on to the people straight away," and "Say, though, I'm shying off the main point," not to speak of a touch here and there of untimely cockney. However, when one has mastered the jargon one finds her an amusing person in a mild way. Her vivacity, her pursuit of the joke, her "cheek," her physical charm, belong to a true though probably obsolescent American type. She goes to India chiefly to attend the "Great Durbar" at Delhi, and under the spell of that pageant fairly forgets to speak or think United States. That the Vicereine should be an American, is, to be sure, a rapturous consideration. . . . "That one of us of whom we are most proud, that one from our country in the West who has risen to a position far beyond that of any other of her daughters." Our heroine is herself of a rising disposition, and is not far from being a duchess when she withdraws herself from our view.

Short Cruises. By W. W. Jacobs. New York: Charles Scribner's Sons.

These cruises, largely by sailors, but of the land, or at the most, of the port, are in the author's familiarly amusing vein. His invention is varied, his humor, on his chosen lines of cartoon and caricature, boundless, and his mastery supreme of what in respectful homage we venture to term slanguage. The practical joke, the admonition by craft, the object lesson through wile have their perfect work in these pages. If the fun possibly makes especial appeal to masculine readers, feminine ones should observe that it is always the woman who gets the best of it.

Ivan Tourguénief: la vie et l'œuvre. By Émile Haumant. Paris: Librairie Armand Colin.

The Polish Jew: His Economic and Social Value. By Beatrice C. Baskerville. New York: The Macmillan Co. $2.50.

The juxtaposition of the two volumes here named is justified by a closer connection than the mere common relationship to the Czar's empire. M. Haumant's main object, without slighting the personal side of his theme, has been to arrive at an understanding of the Russia of Turgenieff, and of the forces that have changed it into the Russia of the present day. Miss Baskerville's book more than suggests what one of these forces has been. The problem is largely psychological. It involves the apparent transformation of national character from a standard condition which the works of the great prose writer have made familiar to the outside world, to an enormously different condition which the works of a revolutionary people are now making violently manifest to the same puzzled outside audience. It is no exaggeration to say that Russian life, as the Western world knows it, or believes it knows it, to-day, is largely what Turgenieff has painted it in those masterly short tales and novels which are so emphatically studies in character and manners and little else.

The old Russia of to-day, in so far as it still exists, and undoubtedly the transformation of the national character is by no means complete as yet, still bears the stamp of inefficiency which marks the hero of Turgenieff as embodied in the Bazaroff of "Fathers and Sons," the Rudin in the novel of that name, and the Nezhdanoff of "Virgin Soil." Inefficient it is more correct to call them than failures, because, after all, a personality that lives out its time in accordance with the laws of its

own nature can scarcely be called a failure; and certainly Turgenieff's heroes are true to themselves and their own weakness. As Turgenieff saw them, his countrymen, for the most part, fell into two classes, the Hamlets and the Don Quixotes: either they had no power of seizing on a definite aim and fighting their way to it successfully, or else they rushed with unwise abandon towards the single attainment of an object that was, from the practical point of view, not at all worth while. The strong man is made so by a certain narrowness of intellect or an intensity of passion that compels the acceptance of all means necessary for the attainment of a determined end. But in Turgenieff's novels the men are too broad of intellect not to be aware of other possible objects of ambition, and too little passionate to obey unscrupulously the behests of desire.

So insistently weak are the Turgenievian heroes, that suspicion of their fidelity to truth has not failed to arise. Some would have it that the author himself created the type of the weakling which he gave to Europe as the embodiment of his country. Others assert that he merely exaggerated. The former charge is scarcely tenable in that his favorite type of masculine character meets us everywhere in modern Russian literature, and is, in fact, designated by the name of a personage—Oblomoff—in the work of another writer. That Turgenieff exaggerated may be more easily maintained. The fact that his men and women are drawn from a comparatively narrow *milieu* tended to overemphasize their vices as well as their virtues. They are for the most part of noble though possibly obscure birth, of easy means, possessed of a more or less thorough acquaintance with the civilization of Europe, and, in the case of the men, of a university training. The men, in fact, are largely Turgenieff himself; at heart a pessimist, a poet, kindly, with no overplus of physical courage, with measured passions, a cleanly healthy nature that revolted at the insalubrious cynicisms of his friends among the French co-littérateurs, and that thorough indecision of character which, in spite of long years of chafing against exile and longing for home, left him to die in exile and away from home. And so, possibly because he looked too much within himself when he wrote, his heroes have a sameness which is creative of wrong values for Russia taken at large. There must have been strong men in Russia in Turgenieff's time, but they were not to be found in the class of occidentalized gentry, whom he preferred to deal with. Their emergence in our own time is just the great cause that has modified the average tone of the Russian character. Turgenieff foresaw them in his "Fathers and Sons" and "Virgin Soil," but these new men were not as close to his heart as the Hamlets and Quixotes of an earlier day.

If so many of the novelist's heroes are women in their volatile emotionalism, in their fear of hostile contact, and even in an exaggerated voluhility, which leaves them no energy for action, his women, like the best-known type of Russian women of the present day, are men in their simplicity of speech and restraint of hearing, in their clear-eyed superiority to convention, in their efficiency, to sum up, by which is meant the power of decision to select a goal and the power of persistency in striving towards it. Why the novelist's women should have been so definitely superior in courage and strength to their brothers and husbands, is one the mysteries of race which, as Turgenieff declared, can never be fathomed. Possibly the position of the average woman of noble family as the mistress and director of numerous domestic servants and serfs, and at the same time as the subject of patriarchal power vested in the head of the household, may have combined to develop in her capacity for actiou with the power of restraint. Possibly by mere contrast with his invertebrate men, the author's women gain in firmness of character. Possihly it was because they were not overeducated in the philosophy of the West.

These were Turgenieff's men and women, and, hy inference, this was the Russia of his day. How now has it come about that in revolutionary Russia of the present day, we find a decisiveness, almost a ruthlessness of action. a power of initiative, in other words, an efficiency, which thirty years ago would have seemed incomprehensihle to a reader of Turgenieff? Have the men whom he knew changed, or have new men come to take their place? Both things have happened, though the former to a minor degree. The Russian intellectual has learned to wear his Western knowledge more easily. A university career no longer brings in its wake the old internal chaos. But more important has heen the appearance of types that we do not often meet in Turgenieff. The novelist not only dealt by preference with the Russian gentry, but he dealt almost exclusively with the Great Russian nohleman. The other nationalities within the empire are, on the whole, represented in no favorable light, Now it is precisely these nationalities that are giving the tone to the Russia of the present time. It is the Great Russian, the *mujik* of the centre of the empire, that as yet needs to be awakened. The other peoples, Jews, Letts, Poles, and Caucasians, are the chief bearers of the present revolution.

It is well, theu, to go to Turgenieff for a basic knowledge of Russian character; but it should he recognized how profoundly non-Russian traits have come to affect the manifestations of that character. Miss Baskerville's hook brings out with exceptional force the rôle played by the Jews; and this may be said in spite of the writer's apparent bias against the race with which she deals, revealing itself frequently in actual violence of statement. The substantial truth is there, hut it is truth without sympathy, and with much distortion. By itself the volume would be open to severe censure on the point; but as a study of the restless Hehrew energy that is so active in stirring Slav indifference and hesitation towards fruitful action, it serves its purpose.

The Appeal to Arms and *Outcome of the Civil War*. By James K. Hosmer. [The American Nation, vols. xx. and xxi.] New York: Harper & Bros. $2 net each.

Mr. Hosmer's volumes have substantial merits. For one thing, they are eminently readable, and any one who begins them will feel disposed to finish them. Thanks in part, no doubt, to the distinctive character of the period, there is little overlapping of previous volumes, though the ground covered by Admiral Chadwick in his "Causes of the Civil War" is necessarilly a little trespassed upon. Maps are more numerous than in preceding volumes of this series, though battlefield plans are rare; while the bibliographical chapters form an elaborate exhibit of the literature, both documentary and narrative.

Military history, save for the initiated, is proverbially hard to write, the narrative, as a rule, being either unconsciously crowded with details whose significance only military experts can appreciate, or else so shorn of incident as to touch only upon the most important campaigns or the careers of the most noted leaders. Mr. Hosmer, himself a participant in the war, deserves praise for the success with which he has avoided both of these rocks of offence. His accounts of military operations are easy to follow, while the interspersion of hrief, graphic characterizations of leading actors, Union or Confederate, at their first appearance is an effective device. In other words, the volumes are a history of the war, not of typical episodes in the war. It cannot be denied that the narrative often seems hurried, and that critical moments, such as those presented at Gettysburg or just before the surrender of Lee, are lightly touched; but the plan is at least consistent with itself.

Original discussions of disputed points are hardly to he looked for in condensed works of this character. Mr Hosmer confines himself, for the most part, to a careful and moderate statement of the case, or a cautious indication of the trend of expert opinion. As to the numhers in the opposing armies, he follows Levermore's figures; as to the treatment of prisoners, his agreement is frankly with Mr. Rhodes. He does not hesitate to condemn the inaction of McClellan or the pompous declarations of Pope on the one hand, or to defend the course of Halleck on the other. At other times he seems to stay his hand: one feels, for instance, that he would like to criticise Lincoln's efforts at military direction rather more strongly than he does, and that he admires Grant more for his dogged persistency and ultimate success than for the inherent merit of his military operations save at Vicksburg. On the vexed question of morals presented by such episodes as Sheridan's devastation of the Shenandoah valley and Sherman's march to the sea, his attitude is that of unapproving resignation: these were indefensible acts, but they were not typical; their justification is in the inherently brutal nature of war; and the Confederates, so far as they had opportunity, were as bad as the Federals.

Of civil happenings during the war, Mr. Hosmer gives, as in the case of military operations, compact and rapid surveys, adequate so far as the general plan of his volumes is concerned, but hardly more than elementary sketches from any other point of view. Doubtless, the economic history of the United States during the Civil War is yet to be written, but we must again express regret that the writers of this admirable series should throughout have dealt so slightly with economic topics. The

important and extremely interesting work of the "war governors." also, recently examined by William B. Weeden in his "War Government," is here little more than alluded to; and the same thing must be said of the internal history of the Confederacy. Outside of military affairs, in short, Mr. Hosmer's narrative is, as a whole, conventional. Nevertheless, these volumes well sustain the general level of the series to which they belong, and undoubtedly constitute the best short history of the Civil War that has yet appeared.

The Hammermen of Edinburgh and their Altar in St. Giles Church. Being Extracts from the Records of the Incorporation of Hammermen of Edinburgh. With Introductory Notes by John Smith. Edinburgh: William J. Hay.

A picturesque title always counts for something, and Mr. Smith's book, "The Hammermen of Edinburgh," is sure to catch the eye, whether in the catalogue or on the counter. The hammermen in question were neither political nor ecclesiastical zealots, but simply craftsmen who at the close of the Middle Ages secured incorporation and were during the next century or so a factor in the artistic life of Scotland. Altogether there were eight branches of this association, inasmuch as the metal workers of Edinburgh comprised blacksmiths, goldsmiths, pewterers, lorimers, saddlers, cutlers, hucklemakers, and armorers. The charter granted to these artisans in 1483 was called the *Seill of Cause,* and like other mediæval charters it claimed an almost idolatrous reverence from those who shared in its privileges.

It may seem that 1483 is a very late date for the establishment of such a society, but Scotland, in economic as well as in intellectual development, lagged far behind the rest of Latin Christendom. It was in the middle of the fifteenth century that the first great stimulus was given to both education and manufactures. The founding of the University of Glasgow by Pope Nicholas V. in 1447 was followed two years later by the rise of an industrial movement. We allude here to the results which attended the marriage of James II. to Mary, daughter of Arnold, Duke of Gueldres. In the train of the bride there came to Edinburgh first new articles and then new craftsmen. Competition between the alien and the native led to an unprecedented activity among the Scottish artisans, together with fresh signs of willingness to seek strength through union. During the two generations which lie between 1456 and 1523 seventeen trades applied to the Town Council of Edinburgh for incorporation, the motive in each case clearly being a desire to secure increased protection.

Having their birth at this period, the hammermen of Edinburgh displayed great vitality throughout the age which just precedes John Knox. Mr. Smith shows himself extremely sympathetic toward that branch of the Christian body which the average Scot has long associated with the Scarlet Woman.

> Whatever [he says] may now be the opinion held regarding the Roman Catholic Church, the fact that in Scotland art, literature, culture, aye, even the trade and commerce of the land, were fostered and nourished by her remains; and it is clear that the trend of her efforts was linked with the welfare of the people. She encouraged everything that made her churches and services beautiful, and drew around her at all times men and women who nobly devoted their labor and substance for those ends. To-day, alas! all over Scotland the testimony of that devotion and trust lies buried in the ruins of fair cathedrals and abbeys.

Whether this passage represents theological or archæological enthusiasm, we need not stop to enquire. The main thing is that Mr. Smith finds his largest subject in the contribution made by the hammermen to St. Giles's Church. Any one who has looked into Chaucer or into Maitland's "Dark Ages"—leave alone the *Acta Sanctorum*—is very familiar with St. Eligius, who becomes the St. Eloi of the Prioress's oath in the prologue to the "Canterbury Tales." The story of Eligius at the court of Dagobert is one of the best anecdotes that have come down to us from the dark ages, and it is not strange that this saint, who was first of all a goldsmith, should have become the patron of metal workers for five hundred years. According to Mr. Smith's contention Sir Daniel Wilson is responsible for a rather glaring mistake in the popular mind regarding the site of "St. Eloi's chapel" in St. Giles's. Without entering upon his special discussion of this point, we may observe that the *chef d'œuvre* of the Edinburgh hammermen was their altar to the patron of their craft as erected during the half-century which followed 1500.

The present volume consists of two parts, the first embracing a series of short essays on matters connected with the Guild of Hammermen, and the second containing extracts from the guild's records between 1494 and 1558. As can be seen from the entries in the ledger of these craftsmen, their devotion to St. Eloi was very great, and upon the embellishment of his shrine they lavished their substance with all the usual generosity of the Scotch. The documents published by Mr. Smith should prove interesting to students of Scottish family history and social life, no less than to those for whom the book is chiefly a contribution to our knowledge of Scottish industry and art. Altogether the volume is an excellent example of antiquarian research pursued with thoroughness and well set forth.

The Reform Movement in Judaism. By David Philipson. New York: The Macmillan Co. $2 net.

The movement in Judaism towards emancipation from within, which began side by side with emancipation from without, is elaborately treated by Dr. Philipson, so that his work is practically the first of its kind in English to give an extended history of Jewish reform, as it is called, for the past century. The story, however, is so recent that it is difficult to write *sine ira* of an agitation which was inevitable as Ghetto legislation passed away and the Jew, gradually admitted in most lands to civil and religious liberty, entered upon an era of slow readjustment. It must be clearly understood that the new movement, which in reality is no new movement at all, does not touch so much the foundation of Jewish belief, as the question of traditional usages in synagogue and home. Hence it can hardly be termed a Reformation in the Protestant sense of the word.

The author, who is clear and fairly objective throughout, does not attempt a history of rationalism in Judaism—in many respects a more vital and fundamental topic—but gives an account of the nineteenth century reform movement. He deals chiefly with Germany, which has so markedly influenced, in recent decades, American Israel, although England, where reform has been arrested, as well as Hungary and France, receives some attention. Of the men who were leaders, Holdheim and Geiger are the most prominent. The rabbinical conferences of 1844-6 are discussed at length, as also the Leipzig and Augsburg Synods, which were hardly as far-reaching as historic synods in general. The spirited opposition that followed the movement against traditional interpretation of Judaism, in which Z. Frankel and S. R. Hirsch were among the more representative champions, is told with considerable fulness. The movement was inevitable with changed conditions and conceptions of modern life, and, as Dr. Philipson says, its purpose has been to institute "the universal and spiritual teachings that accentuate Judaism's message of ethical monotheism" for the "nationalistic, legalistic, and ceremonial form." Such an emphasis was doubtless necessary, but it remains to be seen if Judaism can yet survive, without its traditional and universal form, as a wholly spiritual and ethical institution. The author is to be commended for his careful and scholarly work, and his book is eminently readable.

Julie de Lespinasse. By the Marquis de Ségur; translated from the French by P. H. Lee Warner. New York: Henry Holt & Co. $2.50 net.

M. de Ségur's volume, though ample and interesting, contributes but little of real weight to a familiar story. His principal initial point consists in disposing of Bachaumont's offhand assertion that Cardinal de Tencin was Julie's father, and substituting a conjecture which, while complicating her situation, explains quite naturally the immediate interest taken in her by Mme. du Deffand. From private archives, such as the records of the noble families of Vichy, Villa Hermosa, etc., not accessible to other biographers, detailed information has likewise been drawn for the portraits of the Marquis de Mora and the Comte de Guibert, the two men who divided the passionate interest of Mlle. de Lespinasse's life. The nature of her feeling, at least in regard to the latter, is here in nowise obscured; without rehearsing M. de Ségur's carefully verified narrative, we merely quote in corroboration from the seventy-second letter to De Guibert: "Si un jour vous deveniez parfait . . . comme le froid Grandisson, mon ami, je vous admirerois; mais je serois radicalement guérie."

Easy-going tolerance of equivocal situations was the order of the day in eighteenth-century Paris; what gave, and still preserves, to this *liaison* its unusual character was the long heart-tragedy which resulted from the intrusion of elementary human passion, no doubt widely suspected at the time, though not fully revealed till the first publication of the letters in 1809. The present biography succeeds in giving

a lively impression of the group that gravitated around this hidden drama, from D'Alembert, whose last years were darkened by its discovery, to "l'endiablé Galiani qui soufflait des horreurs au perroquet." But beyond this, we learn little more than was already contained in the studies of Sainte-Beuve and Charles Henry, or in the excellent introduction to the letters by Eugène Asse, in 1876.

The absence of an index is unaccounted for. In the translation not many errors of detail call for correction, but we may ask the authority for "notorious honesty" as describing a woman's virtue (p. 236); and where did Horace Walpole say that Madame de Boufflers "is eternally posing before a biograph" (p. 176)? Walpole feebly anticipated Goldsmith's "The Citizen of the World" and Macaulay's New Zealander. Did his prophetic soul foresee the penny-in-the-slot?

Science.

The Reptile Book. By Raymond Lee Ditmars. New York. Doubleday, Page & Co. $4 net.

This volume is the thirteenth in the Nature Library of this publishing house, and it bears comparison with the best in the series. The title is rather misleading, as the scope of the work is limited to the reptiles of North America; although even in this restricted field, the author finds abundant material to his hand. In his position as curator of reptiles in the New York Zoölogical Park, Mr. Ditmars has taken advantage of the unequalled opportunities afforded by the park collection and has brought together a host of interesting facts and a great number of photographs from life. Eight of these are in color, and although they will appeal to the average reader, yet so difficult is it even to approximate the colors of nature, that one would wish them all in black and white. Most of the illustrations are perfect as to detail and admirable as to background. It is safe to say that as a whole the photographs form a graphic representation of our reptilian fauna which is unsurpassed. Of especial interest are photographs of young reptiles, and of the eggs of many species of turtles and serpents. The frequent introduction of inch rulers, to show the comparative sizes is an important feature. The general reader will also be grateful for the lettered plates, identifying the elements of the cephalic scalation, which are so important in the classification of lizards and serpents; and for the methods of taking measurements (plates 31 and 32), although these, for more ready reference, should have been inserted in the front of the work.

The text is a notable addition to popular herpetological literature, but we cannot agree with the author that this field is a gap which "has steadily remained unchanged." Such an assertion is unfair to the contributions of Dr. Hermon C. Bumpus to volume iii., of the "Riverside Natural History," and of Prof. Hans Gadow to the Cambridge series.

For the sake of popularization, references to anatomy, embryology, and general evolution have been omitted, perhaps wisely, as these phases of the subject are well treated in Gadow's work. A key to each group is followed by the specific descriptions, dimensions, distribution, and habits. In the simplicity of identification tables and especally in the large number of facts as to the habits of reptiles in captivity, this volume is unexcelled. The data concerning the diet and care of reptiles will be of material help to future students and investigators, and this feature of the treatise is the most valuable, as it is certainly the most novel. The illustrations and text relating to the turtles and tortoises are unusually welcome, owing to our scanty knowledge of these creatures. Also of great interest is the account of the ejection of 103 drops of blood from the eyelids of the so-called horned toad, apparently a defensive adaptation which has been recorded and refuted many times. The introduction of the term horned *lizard* in place of the usual but incorrect name, is worthy of imitation by some of our mammalogists and ornithologists, who humbly bow to public opinion and perpetuate such atrocities as prairie *dog* and wood *ibis*. In the final chapter, the rattlesnakes are thoroughly discussed, including the history of the development of the rattle.

It is to be hoped that this work, in its explosion of many popular superstitions and fears based on ignorance, will decrease the unreasonable dislike which the "great majority" bear toward all reptiles. Indeed, with this volume at hand, there remains little excuse for the indiscriminate killing of snakes, or for instilling into children the unreasoning dread of all reptiles —a dread which is never congenital, but which when once implanted, is so difficult to overcome.

"Van Nostrand's Chemical Annual" for 1907 (D. Van Nostrand Co.) is a handy volume for the laboratory, containing 400 pages of tables. The properties and numerical constants of a large number of organic and inorganic compounds are given, as well as logarithmic tables for the calculation of analyses. The classified bibliography of the most important articles and books published since January 1, 1905, will save the chemist much time and trouble. Hitherto the American chemist has been dependent on British and German annuals, but this new publication is in some respects better adapted to his needs. The work is edited by John C. Olsen, professor of analytical chemistry, Polytechnic Institute, Brooklyn, with the coöperation of eminent chemists.

In *La Nature* (No. 1765) an account is given of the experimental determinations of longitude between Potsdam and the Brocken, by Prof. Albrecht, by means of wireless telegraphy. The results are excellent.

Drama.

Sappho and Phaon. By Percy Mackaye. New York: The Macmillan Co. $1.25 net.

Mr. Mackaye's work is the most notable addition that has been made for many years to American dramatic literature. It is a true poetic tragedy, classic in form and spirit, not always glowing with the fire of genius, but nevertheless charged with happy inspiration; dignified, eloquent, passionate, imaginative, and thoroughly human in its emotions. It is a great advance in almost every respect upon his "Jeanne d'Arc," and, whether considered in the light of literature or drama, need not fear comparison with anything that has been written by Stephen Phillips or John Davidson.

The author has availed himself boldly of the license afforded by the vagueness of our knowledge of the Lesbian poetess. The surviving fragments of her verse, which he has plainly studied, reveal more of her intellect and philosophy than conflicting legends do of her life and character. In his conception she is a superb pagan with modern aspirations, the virgin paragon of her band of maiden disciples, warding off the importunities of many suitors with intellectual fence, while awaiting the advent of the predestined and ideal lover. When Pittacus, the tyrant of Mitylene, lays his crown at her feet, she answers him parabolically, asserting her female prerogative to choose her own mate and raise him to her own level. She has been smitten with a sudden passion for Phaon, a magnificent fisherman slave. Trembling at her own impulses, she at first meditates casting herself into the sea beneath her—the whole action passes in the open space before a temple of Neptune on an Ægean promontory—but soon rallies her energies in a soliloquy of which the greater part deserves quotation:

The teeming, terrible, maternal sea
That spawned us all. She calls me back to her,
But I will not go. Her womb has brought me forth
A child defiant. I will be free of her!
Her ways are birth, fecundity, and death,
But mine are beauty and immortal love.
Therefore will I be tyrant of myself—
Mine own law will I be! And I will make
Creatures of mind and melody, whose forms
Are wrought of loveliness without decay,
And wild desire without satiety,
And joy and aspiration without death;
And on the wings of those shall I, I, Sappho!
Still soar and sing above these cliffs of Lesbos,
Even when ten thousand blooms of men and maids
Are fallen and withered.

Soon she encounters Phaon, who has brought his slave mate, Thalassa, to offer a dove to Neptune as a sacrifice for their sick babe. Sappho, who reminds him of a vison of Venus vouchsafed him in his early youth, exercises a powerful fascination upon Phaon, but is unable to overcome his loyalty to the mother of his children. She induces them, however, to sell her the dove, intended for Neptune, which she immediately sets free in honor of Venus, with a triumphant rhapsody:

O darling bird, which art my beating soul,
That Phaon captured on these wild sea cliffs,
Mount up, mount up! and nestle with thy wings
Against the burning chlamys of heaven's queen
There where her breast heaves highest.—Say to her;
"Lady of love, almighty! This is Sappho—
Her spirit—whom thou madest of that fire
Which sleeps in Phaon's eyes. Lo, I am his,
And I will make him mine!"

The wrath of the offended Neptune hastens the impending tragedy. Sappho awakens the slumbering soul of Phaon by conferring upon him his freedom—which she has won from Pittacus—and stirs the hero in him by giving him her spear, effecting in him a transformation which is finely

imagined and most dramatically set forth. Henceforth he will be master:

Nevermore
Shall you be sovereign of your maiden will
Or single in your fate. Not here with priest
And song, but with a spear, you have betrothed me.
O thou my spear, that singest in my hand,
Thou art my power and manhood. Face to face
Thou pittest me in combat with the gods
And raising thee, my mind is raised up
Confronting heaven, till from those clouds of fire
This slavish world grows dim, . . .

But in the very moment of exaltation he is obliged to flee, for Pittacus has given him again into slavery to Alcæus, his bitterest foe, who is approaching with an armed band to seize him. In a passionate scene Sappho volunteers to descend the face of the cliff with him, and so the lovers escape to Phaon's boat. But the sea is deep in impenetrable fog, and Phaon, recognizing the angry intervention of Neptune, insists upon returning, to pacify him with a living sacrifice, in spite of Sappho's protest.

Stoop not to this
Our wills are their own Providence, and shape
The mandates of the immortals to their ends.

Already the heroic ecstasy of Phaon, born of Sappho's magnetism, is perishing in the fog of slavish superstition. Bent on the living sacrifice, his only hope, he advances toward the temple pillar behind which he believes his enemy Alcæus to be concealed, and striking blindly in the darkness kills his own eldest boy, who was seeking him. It could be wished that Mr. Mackaye had invented some less theatrical expedient for the consummation of his tragedy, but the ensuing scene, in which the remorseful father turns again to his slave-mate, the bereaved mother, Thalassa—a name of dread significance to Sappho—is masterfully written, with deep pathos and unmistakable poetic power. Sappho, perceiving that her dominion over Phaon is lost, and that he now regards her only as an avenging deity, hurls herself from the cliff top. Her last words, however, are a song of triumph:

Nor thou, Poseidon, shalt extinguish me.
My spirit is thy changeling, and returns
To her who glows beyond the stars of birth—
To her, who is herself time's passion star.
Beautiful Sister, goddess of desire,
Come to me! Clasp me in your wings of sunrise
Burning, for see! I go forth to you burning
Still.—Aphrodite!

The present limits of space permit only an allusion to subsidiary personages and incidents which are conceived with lively fancy and a keen sense of dramatic effect. The classic tone is preserved without pedantry or affectation. Sappho in herself is a notable creation, both in respect of her artificial endowments and her natural instincts. Phaon, too, is a fine study, in his original torpidity, in his momentary awakening, and his pathetic relapse. Of the ingenious prologue, induction, prelude, and epilogue by which the author links the dead past with the ever-dying present, this mention must suffice. The whole piece is full of an eloquent symbolism for those who choose to look for it.

A new play by Victor Hugo has been unearthed and performed in Italy. It is called "The Marchioness Zabeth," and was written in his early youth. The plot, according to a correspondent, tells of Lisette, a little orphan peasant. She is engaged to be married to a young man of her own station. But she is full of romance, dreams of palaces and golden coaches, and joyfully expects to see Prince Charming one day. He comes in the person of the Duke of Galius, blasé and a skeptic. He immediately desires to win Lisette, and takes her away in his golden coach. In the second act she is in the palace of the Duke, surrounded by the libertines of the town. She sees herself despised, and longs to return to the pure and simple life of former days. At last she dies—dies, she says, because she is not loved. At this the duke protests that he loves her passionately, but has kept the knowledge of this from her, as he wished to try her. It is said that Hugo never intended that the piece should be played.

Mr. Tree has arranged with Stephen Phillips to join with J. Comyns Carr in the preparation of the new version of "Faust," which is to be produced at His Majesty's.

Lewis Waller has a new play by William S. Maugham called "The Explorer," which is founded in part upon the history of Cecil Rhodes. But the chief dependence of the piece is upon the love interest.

Music.

SHOULD MUSICIANS PLAY WITHOUT NOTES?

One of the many new things introduced by Liszt in the concert halls was the custom of playing whole programmes by heart. Of the eighty pieces presented at his twenty-one Berlin concerts in 1842, he played fifty without notes, to the dismay of the professionals. To be in the fashion, they soon found it necessary to follow his example, and the time came when no one was considered ripe for the concert hall unless he could play a score or two of pieces without the aid of the printed music. Some of the feats accomplished in this direction border on the marvellous. A trustworthy Viennese critic, writing from personal observation, has asserted that if half a dozen bars of any one of Chopin's pieces are shown to Moritz Rosenthal, the rest of the page being carefully covered, that pianist will promptly name the piece and play it by heart.

Once in a while a voice is raised against the tyranny of the fashion of memorizing all the music performed in public. Ten years ago Dr. Karl Schmidt wrote an article in the *Centralblatt für Instrumentalmusik*, in which he maintained that the art of rendering by heart a long composition, especially with orchestral accompaniment, is a needless accomplishment; that it is not expected of singers or of conductors (although some conductors do practise it); that it involves a loss of time; and that if it were discarded we should hear a greater variety of works at our concerts.

Without having cognizance of this article, Prof. Wilhelm Altmann contributed one of similar tenor to the first March number of *Die Musik*, in which he dwelt with particular emphasis on the fact that the habit of playing none but memorized pieces is largely responsible for the tiresome monotony of piano-recital programmes. He is undoubtedly right, and as that same monotony is really the cardinal defect of such recitals, and one which does much to diminish their popularity, it is at least an open question whether, all things considered, anything is gained by keeping up the present custom. Undoubtedly the pianist who plays without notes has the same advantage which an orator has over one who merely reads aloud. Many eloquent orators, however, have their manuscript, or a sketch of their speech, before them, to be momentarily referred to in an emergency; and this suggests that pianists also might with advantage have the printed music before them, and some one to turn the leaves. In all probability it would never be looked at; but the mere fact of its presence would cure the nervous dread which often prevents players from doing their best. No less a man than Rubinstein confessed in the last years of his career that he often suffered agonies at the thought of his memory suddenly failing him. The procedure just suggested would have prevented this. It is practised by Pugno, and no one can say that there is less of the impromptu, unrestrained character in his playing than in that of his rivals who rely altogether on their memory.

In the first May number of *Die Musik*, Marie von Bülow, widow and literary executrix of the great pianist, contributes a few pages on this topic. She refers to the fact that Hans von Bülow habitually memorized his part even in chamber music, a practice which seemed almost "uncanny" to his fellow players. In New York, on May 10, 1890, he and D'Albert played without notes Bach's double concerto, and in Berlin, subsequently, the Haydn variations by Brahms for two pianos. Bülow could read over a difficult new piece a few times in a railway car, memorizing it with his eyes, and then, without looking at it again, sit at the piano and play it—which also seems uncanny; for in this case he did not have the aid of what may be called finger memory, independent of volition. His pupil, Vianna da Motta, relates that once, when a student made a number of mistakes, Bülow exclaimed: "There, you see! that comes of the accursed outward memorizing and playing of what has not yet been learned inwardly. Never mind playing without notes: I would rather have you play with them. By playing by heart you want to impose on us; but we are beyond that, aren't we? I don't want any feats here." This does not prove that Bülow would have counselled his pupils to use their notes in the concert hall also. A pianist who could, as Vianna da Motta relates, sit down at a second piano, and without having looked at the music, correct any errors made by the pupil, could hardly be expected to sympathize with mortals less well endowed as to memory.

There has been no lack of dictionaries of musical terms, but most of them appeared before the day of the cheap miniature scores which have made it possible for all to study the great orchestral works in their entirety instead of in mere arrangements for pianoforte. For this reason it occurred to Tom S. Wotton that there was room for another dictionary in which more attention would be given than in the others to the terms and directions given in full scores. The result is "A Dictionary of Foreign Musical Terms and Handbook of Orchestral Instruments"

(Leipzig: Breitkopf & Härtel). The title is somewhat misleading if it suggests that foreign words only are explained, for the principal English terms are not omitted; but the foreign terms are the main feature of this volume, and they are presented more fully than elsewhere. The definitions are usually clear; a felicitous example is Saxophone: "an instrument with a body of metal (but not on that account classed amongst the brass), and played with a single reed like a clarinet."

Next season's programme of the People's Symphony Concerts in this city, under Mr. Franz Arens, will embrace the same number of concerts as were given during the past successful season: Four symphony concerts and six chamber concerts at the Cooper Union large hall, and four symphony concerts at Carnegie Hall. No tickets will be sold at the music stores, as has been the custom during former seasons. They can be purchased only at the office of the society, No. 32 Union Square East, and at the institutions that coöperate with it.

Art.

A Theory of Pure Design. By Denman W. Ross. Boston: Houghton, Mifflin & Co. $2.50 net.

Professor Ross has been engaged for many years in the study and teaching of pure design—design, that is, altogether dissociated from representation, and consisting of the arrangement of entirely meaningless shapes, measures, and tones. His problem is to produce something from which all suggestion of, or association with, anything outside itself shall be banished, something which shall be absolute design, like absolute music; to discover the laws of design by eliminating everything which can interest or please for any other reason than its subjection to these laws. He has at length, "with great reluctance" given to the public the results at which he has arrived, and is modest enough to consider these results "inadequate and unsatisfactory." His book, he says, "will hardly be published before I shall discover in it errors both of omission and commission. . . . It is inconceivable that this, my first published statement, should be either consistent or complete . . . It is simply the best statement that I can make at this time." And he specifically invites coöperation, suggestion, and criticism from other students of the subject.

His book is "a contribution to science rather than to art," and it is written in a strictly scientific style, with numbered paragrapbs, definitions, diagrams and tables. It is not to be read but to be studied, and one should judge it finally only after making for one's self the experiments it recommends, not after a mere perusal of its highly abstract statements. For such studies a reviewer cannot take the time—his review might be ready three or four years from now—and the actual practice of design does not necessarily constitute the practitioner such a "student" of its principles as is invited to criticise. One must apologize, therefore, for such hasty and impressionistic criticism of his treatise as is here offered, based though it is on the occupation of a lifetime with the matter treated.

The impression given by a reading of Professor Ross's volume is a singular one. Each definition seems precise, each paragraph logical, and the sequence of ideas seems clear, the argument convincing; yet one goes on to the end with an increasing dissatisfaction, a growing sense that something is wrong, that there has been somewhere a vital omission. It is not that the author's illustrations of his principles do not strike one as beautiful—he has discounted that in advance—but the principles themselves, singly or all together, will not account, satisfactorily to one's mind, for those things which are beautiful. Indeed it may be said that they do not pretend to do so. Professor Ross begins by disclaiming any knowledge of what beauty is; but he says:

> While I am quite unable to give any definition or explanation of Beauty, I know where to look for it, where I am sure to find it. The Beautiful is revealed, always, so far as I know, in the forms of Order.

He admits that a thing may possess order without being beautiful, but believes that it cannot be beautiful without order and that beauty is to be found in "supreme instances of Order." "In the practice of Pure Design we aim at Order and hope for Beauty." We must consciously strive for order and for nothing else, trusting that by a kind of felicity we may achieve such a supreme instance of it as to reveal beauty. The difficulty is that the nearer we get to supreme instances of order, according to his definitions of the modes of order, the farther we get from what we know as beautiful.

The modes of order which he recognizes as principal ones in design, are harmony, balance, and rhythm. It will be noted that he does not include proportion, believing that ratios are not "visually appreciated," and ignoring the fact that they may possibly be felt. The ratios of length in sound waves are probably not appreciated by the ear, in any strict sense, but do they not produce a result of harmony which is appreciated? In this we think he is wrong, but it is a detail. Let us take his definition of the modes of order he does recognize and see whither they lead us and him. It is unfair to him to condense what is already condensed, but we shall try to leave out nothing essential.

> Whenever two or more impressions or ideas have something in common that is appreciable, they are in harmony in the measure of what they have in common. The harmony increases as the common element increases. . . . It diminishes in the measure of every difference or contrast. By the Order of Harmony I mean some recurrence or repetition, some correspondence or likeness.
>
> By the Order of Balance I mean equal opposition and consequent equilibrium, as it occurs at some moment of Time or at some point of Space.
>
> By the Order of Rhythm I mean changes of sensation . . . which induce the feeling or idea of movement, either in the duration of Time or in the extension of Space; provided that the changes take place at regular and marked intervals of Time or in regular and marked measures of Space. By regular intervals and measures I mean equal or lawfully varying intervals and measures.

Now if the first definition be true, it is evident that two impressions increase in harmony as they approach identity; the highest harmony of pitch would be reached when two notes are sounded in perfect unison, the highest harmony of color when two spaces of color are of exactly the same color. The supreme instance of harmony would be like what Professor Ross says of harmony of positions: "Positions in Harmony are identical positions." Yet he recognizes that this is not harmony at all, and that "there is no such thing as a Harmony of Positions." Likewise the supreme instance of balance would consist of two, or preferably four, exactly similar forces or exactly similar weights at exactly equal distances. In either case beauty would become synonymous with monotony, and much the same thing would hold good of rhythm, the supreme instances of which would be those of the utmost regularity. The most beautiful verse would be that with the most marked and regular rhythm, and all variation in time or accent would be a blemish.

Professor Ross feels the danger of this exaltation of monotony, at least as regards the harmony of colors, for he says:

> There is another consideration which ought to keep us from any morbid interest in harmonious monotonies. . . . Harmony is only one principle of composition in Design. . . . The principles of Balance and Rhythm are consistent with the greatest possible contrasts of Tone.

They are; but as such contrasts are not necessary to the exemplification of these principles, and as they are, under his definition, destructive to harmony, why should they be introduced? He gives no reason. Indeed, his theory brings him, at the end, pretty near the position that, in design, the less one does the better. Why risk destroying the perfect orderliness of a blank space by putting anything into it?

> When only an outline is given and we can put into it . . . tones, measures, and shapes *ad libitum*, we must be sure that in the addition and multiplication of features we do not get less Order than we had in the simple outline with which we started. . . . It may be harder to achieve Order with a greater number and variety of terms. We may deserve credit for overcoming this difficulty, but it is a difficulty which confronts us only when the terms are given. . . . When no terms are given, only a perfectly orderly outline, we should hesitate before we put anything into it. . . .
>
> I object to the word "decoration," as commonly used by designers, because it implies that additions are likely to be improvements, that to multiply features, to enrich surfaces, is worth while or desirable. The fact is that additions are as a rule to be avoided. . . . We ought to make them only when in so doing we are able to increase the order of the whole. We make additions, indeed, to achieve the greater simplicity of Order, and for no other reason. Our object in all cases is to achieve Order, if possible a supreme instance of Order which will be beautiful. We aim at Order and hope for Beauty.

This is the last paragraph in the book, the final word. Enrichment of surfaces is not desirable, additions are not worth while. If you have a wall to decorate, paint it one flat color and you are sure of harmony. Two flat disks, equidistant from the centre, will give you balance, perhaps without over disturbing the harmony, or you might make them squares to harmonize with the boundaries of the wall space. A Greek wave border, or, to avoid curves, a simple fret, will give you rhythm. Perhaps you have, so far, added

more to the perfect orderliness of the empty space than you have taken away, but beware of going any further. And make as little contrast between the tones as possible, for "harmony diminishes in the measure of every contrast." The size of your squares and the width of your border, in view of the fact that proportions are not visually appreciated, must be left to chance.

Such an arrangement might conceivably be sufficient. Without the squares, introduced to give balance, it represents a common enough condition which has a certain dignity and "simplicity of order," but few people will believe that it is the highest form of design or that it achieves any great degree of beauty. Rightly or wrongly, designers have always felt that the enrichment of surfaces is worth while, that multiplicity and intricacy have a delightfulness of their own, that contrast is as precious and necessary as harmony. There has been very little "pure design" produced in the world—very little design that has not some suggestion of representation. The best examples of it are, perhaps, in Celtic work and in the geometrical designs of the Moors. Of both these styles of design, intricacy and multiplicity of parts are the most striking features; in both, the enrichment of surfaces is the most obvious motive. Both indulge, also, in the sharpest of contrasts, the contrast of light and dark, of curvature and angularity. The contrast of black and white has ever been a favorite one, and few designers have been able to get on without the contrast of straight lines and curved ones. In the higher forms of design another element is introduced, that of variety. The great designers have always felt that a rhythm becomes more delightful if it is slightly irregular, that a repetition is enhanced by a certain unlikeness in the units, that balance is more pleasantly achieved when the things balanced are unequal. In the very highest form of design, that of the great painters and sculptors, these elements of contrast, variety, and multiplicity become apparently dominant, and the underlying and really dominant harmony, balance, and rhythm are felt rather than seen.

Here, we think, is the radical defect of Professor Ross's system. He is perfectly right as to the importance, as forms of order, of harmony, balance, and rhythm, to which we should add proportion if only as a mode of harmony. He is wrong in not seeing that the antithesis of each of these qualities is necessary to its greatest effect. It is harmony dominating contrast, balance achieved in inequality, rhythm controlling irregularity, that give us the most acute and pleasurable sensations of harmony, balance, and rhythm. The "supreme instances of order" which produce beauty are instances of order subjecting wilfulness, reconciling variety, overcoming opposition. The highest types of beauty, in nature as in design, are types of the reconciliation of law and liberty, of fate and free will. It is not merely harder, and therefore more creditable, "to achieve order with a greater number and variety of terms"; the order, if achieved, is finer in proportion to the number and variety of the terms it controls, more pleasurable as the terms seem constantly about to escape from it without ever doing so.

The degree to which the conflicting elements of order and freedom shall be admitted in design, is really a question of position and function. In order without freedom we have the lower forms of design, suited to subordinate functions. In freedom without order, or license, we have no design at all. But from the most formal design, in which, however, there is almost always some element of opposition, to the freest and richest in which the dominance of order may still be felt, we have a regular gradation. A design which is admirably suited to one position or function may be unfit for another, and the freer design, out of place, may be the poorer; but, other things being equal, the design of the masters of painting is finer, as pure design and without regard to its representative elements, than that of the mere ornamentalist, because it is composed of many more elements; is richer, fuller, more intricate, and more subtle; and because the power of law is made more manifest by the variety of the elements it controls and more pleasurable by the occult nature of the control it exercises.

These remarks are suggestions only, and we do not pretend to have reduced our ideas to scientific form; but we believe that what we have said contains some glimpses of a truth worthy of attention and study by Professor Ross, and as such we commend them to him.

The following officers and academicians were elected at the recent annual meeting of the National Academy of Design: Officers elected—President, Frederick Dielman; vice-president, Herbert Adams; corresponding secretary, Harvey W. Watrous; recording secretary, Kenyon Cox; treasurer, Francis C. Jones. Members of council—Ben Foster, J. C. Nicoll, Will H. Low, William Sergeant Kendall, J. Alden Weir, Henry B. Snell. Academicians—Paul Dougherty, Edward Gay, W. L. Lathrop, Charles F. McKim, Howard Pyle, W. Elmer Schofield, R. W. Van Boskerck, Charles H. Woodbury, William Gedney Bunce, and Charles Melville Dewey.

D. C. French has presented the Metropolitan Museum with his fine bust of Emerson, modelled from life in 1879. It was of this bust Emerson made his famous remark: "That is the face that I shave."

In the May number, the *Rassegna d'Arte* is characteristically strong in illustrations of inedited pictures, several of which are of high interest. From the collection of the Marchese Campori, at Modena, Signor Tencajoli reports an early St. John the Baptist as a Youth, by Correggio; an oil sketch by the same master, for the Cupid with a Stag's Head in the Camera di S. Paolo, Parma; a portrait of a Young Woman, attributed to François Clouet; and half-length portraits on a long canvas of three Pages of the Este Court, ascribed to Van Dyck. Naturally the attributions are *sub judice*. Small doubt will attach, however, to the wholly charming Madonna Leading the Christchild, by Borgognone, at Buligo (Bergamo), which is described by Luigi Angelini, or to the Nativity, by Gerolamo da Cremona, which Guido Cagnola has seen in the hands of a Milanese antiquarian. This carries the list of paintings by that rare Quattrocentist to four. From Gubbio is reported the discovery of an important fresco of the fourteenth century, which is said to represent the translation of the Santa Casa, by angels, under the Virgin's supervision, from Fiume to Loreto. The subject is an unusual one, and obviously affords opportunities for fine decorative effect.

Alexandre Cesarin, a painter, sculptor, writer, and soldier, died on Sunday at his home in New York. Born in Mexico, he was educated in Paris and began the study of art in the studio of Meissonier. When the war of France and Germany began, he was made a colonel of chasseurs and served under Gen. MacMahon. On his return to Paris he became one of a coterie of artists, among them Fortuny, Corot, Diaz, and Millet, and his own paintings were in demand for private galleries, though he was opposed to exhibiting his works. Sculpture interested him, especially after his migration to this country, and he made busts of President McKinley, Senator Depew, and others. He was a friend of John Ruskin, and of Marie Corelli, who made him the hero of her story, "A Romance of Two Worlds."

Financial.

Convertible Bonds

In the third edition of our 6-page circular, entitled "Convertible Bonds," we describe practically all of such investments now upon the market. In addition, we explain why such bonds, when properly selected, are well regarded by conservative investors, and also why they possess every probability of returning exceptionally large profits.

Properly selected investments are based upon safety and income yield combined; in other words, minimum risk of principal and maximum income return.

STOCK MARKET AND RAILWAY BORROWINGS.

An exceedingly violent break in the stock market, at the opening of the present week, brought prices of numerous important railway shares below the level reached in what Wall Street calls the "March panic." On the Stock Exchange there were reported numerous indications of forced liquidation —that is to say, sales of large blocks of speculative holdings which had so shrunk in value that they no longer provided adequate security against the bank loans arranged to finance them. In the case of some active stocks, prices fell this week below the worst figures reached in the "rich men's liquidation" of 1903.

For this sudden and spasmodic decline, there were three obvious causes. One was the beginning of gold exports from New York to Europe—occurring, as was explained in this column a week ago, for the first time since the middle of 1905. On the money market, it was believed that the $800,000 gold engagement for Paris, last Monday, was hastened by the allowance of "interest in transit" by the Bank of France; that institution lending free of interest to gold importing bankers, as Secretary Shaw did with government funds last year, the money which would, so to speak, be "tied up" while the gold was on the ocean. It was inferred that further gold exports were bound to follow. A second cause was the return, at this week's beginning, of unseasonably cold weather in the wheat-belt. But these two influences were undoubtedly superseded by a third—the continued large offerings of new securities by the railways, at a time when the investing public has seemed more indifferent than for many years to such opportunities.

The case of these railway borrowings has become very remarkable. Last November, it will be recalled, James J. Hill made this extraordinary assertion in regard to the needs of our great railways:

> It is estimated that from 115,000 to 120,000 miles of track must be built at once to take care of this immense business. But to build that amount will cost as much as the Civil War cost at least. It will cost from $4,000,000,000 to $5,000,000,000. A thousand million dollars a year for five years will scarcely suffice. Why, there is not money enough nor rails enough in the world to do this thing.

When this was said, the market answered that, under present conditions, no such amount of capital could possibly be spared. Even last year, when the New York Stock Exchange "listed" $1,234,000,000 new stocks and bonds, $664,000,000 of that amount was merely put out to replace older securities which the companies were redeeming, and perhaps one-half of the entirely new securities were offered, not by railways, but by industrial companies. For 1907, with its disordered investment markets and scarcity of available capital even that achievement seemed inconceivable. Yet, such has been the urgency of the successive railway bids for new capital, that a table compiled last Saturday showed total offers of new railway securities, since the middle of December, to have reached the enormous sum of $792,000,000—or actually, within five months, four-fifths of the total sum named as the annual requirement by Mr. Hill. Of this large total offer, $326,000,000 was in new railway stocks, $180,000,000 in new bonds, and no less than $285,000,000 in short-term notes, mostly with three-year maturities and with rates of interest averaging nearly 6 per cent. And to these railway applications had to be added offers of $120,000,000 new securities by industrial companies, one-half in bonds and one-third in short-term notes.

The practical question of the markets is, how this huge mass of new securities is to find lodgment with investors. They are offered in various ways; some to existing shareholders, on terms more advantageous than similar securities yet give on the open market; some on an outright sale to banking houses; some through "underwriting" bankers, who receive handsome commissions for guaranteeing a sale and standing ready to take the securities themselves if the public will not buy. It is plain enough that such operations depend for their success largely upon the outside investor's attitude. Bankers who buy or "underwrite" such new securities do not expect to hold them permanently. Like wholesale dry-goods merchants, for example, they expect to clear their shelves in the coming season, through sales of the new securities to customers. A merchant, left at the season's end with his warehouse full of unsold goods, would be in a very uncomfortable situation. The banker has to calculate on a larger possibility that his customers will not buy; hence his reserve of personal capital is greater than the merchant's. That capital is as a rule already for the most part invested in interest-bearing securities; if, then, the banker foresees that he will have to hold the new securities for a longer period than he had expected, he must protect himself by realizing on his reserve of old securities.

But the only way to do this is to sell stocks and bonds in the open market, and retain the proceeds for his new investment. There can be little question that this process is going on to-day, as it was in 1903, and that it largely explains the weakness on the Stock Exchange.

BOOKS—All out of print books supplied, no matter on what subject; write me stating books wanted; I can get you any book ever published; when in England call and inspect my stock of 50,000 rare books. BAKER'S GREAT BOOKSHOP, John Bright St., Birmingham, England.

The Nation.

NEW YORK, THURSDAY, JUNE 6, 1907.

The Week.

Speaker Cannon is the real St. George of the standpatters. He slew a tremendous dragon two years ago, killing outright a special tariff message which was just blinking in the unaccustomed light, and would have been on the helpless nation in a few days more. He killed another moderate-sized dragon, so his admirers say, in the shape of a tariff paragraph in the last Presidential message. The latest one he has killed was merely an allusion to the tariff in Mr. Roosevelt's Indianapolis speech. It was hardly more than a snap-dragon, but its decapitation gives Mr. Cannon an absolutely clean record in the matter of dragons. Heroes seldom buy new weapons, and in this respect also the standpat champion sustains the best traditions of dragon-killers. He has used the same sword ever since any one can remember. It is a beautiful but terrible weapon, made in Pennsylvania, and on its blade is engraved a sort of runic inscription which produces a magical effect on every Republican against whom its edge is turned. The runes have been interpreted to read: "It would be a mistake to set the country by the ears over the tariff question on the eve of a Presidential campaign, and would have the effect of unsettling business."

The latest view of the Philippine situation, as set forth by Secretary Taft last week at St. Louis, is also the most altruistic. We began by expecting to coin money out of the Philippines, and at the same time make the natives happy. When we came to realize that there were no profits in our Oriental venture, we could at least fasten attention on the beatific condition of our wards. But the blunt ex-Governor-General now admits that there is neither gold nor gratitude for us in this business. We should marvel at our own unselfishness. But the reasons for the ingratitude of the Filipinos are satisfying, if ingenious. Since the way to benefit an alien people is to make them as much like ourselves as climate and temperament will permit, therefore we must have American officials "for guidance." In order to make Americans accept these places, we must pay them more than natives doing the same work. Yet in spite of the higher pay we do not always secure men "who are properly imbued with the spirit of sympathy for the natives that is essential to prevent race friction." Thus, out of patronizing comes discrimination, and out of that possible misrule. The facts are no longer in dispute, and allusions to the Philippines not couched in apologetic language have grown rare even in Republican speeches.

It is a rare quarrel in which the causes of disagreement are thoroughly understood before the fighting is over. The question of the Japanese in San Francisco schools was certainly not such a *casus belli*, for Mr. George Kennan has just set forth in the *Outlook* the fundamental facts which ought seemingly to have been known to every one at the beginning. What sympathy the anti-Japanese agitators had in the country at large was obtained by their skilful use of the argument that grown men of alien moral ideas should not be allowed to associate in the schools with young American boys and girls. Going to the records, Mr. Kennan has found that on December 8, 1906, out of 28,736 children in the San Francisco schools, there were just 93 Japanese, of whom 28 were girls. Of the boys only 31 were over fifteen years old, and two over twenty. The number of Japanese over fifteen studying in the primary grades, "beside children of tender age," was exactly six. Even granting their bad influence, which Mr. Kennan denies vigorously, there was evidently no "problem" in San Francisco which the simple establishment of an age limit would not have remedied without friction. Yet supposedly reputable newspapers circulated such statements as that the establishment of a sixteen-year limit for scholars in the primary grades "would eliminate 95 per cent. of the Japanese."

It is said that the Waters-Pierce Oil Company, which was expelled from Texas, readmitted to Texas by the exertions of Senator Bailey, and has now been fined $1,623,900, owns within the State very little property on which the tremendous fine can be levied, even if the verdict holds. Very few of our Trusts clear sixteen hundred thousand dollars in less than twenty-four hours, and many would have to keep at work as much as a week. This is the period of the cumulative penalty. Law-breaking corporations have committed such a staggering number of separate offences that the skilful prosecutor assembles them by hundreds at a time before he goes to court. It is much better than some of the farcical prosecutions of other days, which ended in penalties about adequate to the offence of Sunday ball-playing. The "farmer jury" which sat at Austin had a rare privilege in adding up the penalties for the 2,521 days on which the Texas statutes were violated. But the jury really to be remembered is the one that will some day send to prison a few of the men behind the lawless corporation.

Many will feel that the reversal of the conviction of George Burnham, jr., the first of the indicted New York insurance officials to be sent to prison, will destroy the exemplary value of his prosecution. But the law is the law, and the unanimous opinion of the Appellate Division is that Burnham was not convicted according to criminal law. And be it noted that the errors which Justice Ingraham points out in the conduct of the trial are not unimportant technicalities, but go very near the heart of the matter. If the evidence he specifies was improperly admitted, there can be little doubt that Burnham's case was illegally prejudiced in the minds of the jury. This is not saying, and the Appellate Division does not say, that he should not have been convicted; only that the legal steps were not properly taken. On the new trial which the court orders, he may again be found guilty. It is incumbent on the District Attorney's office to know the law, and to secure convictions which will stand on appeal. Criminal appeal undoubtedly has its abuses in American practice, but no one denies that it ought to exist. Lack of it in England has worked injustice so often that the House of Commons is just now passing a bill to establish for the first time a court of criminal appeal. This is intended to prevent such miscarriages of justice as that in the recent Edalji case. With us, the greater evils have undoubtedly been in the misuse of criminal appeal; yet the thing to do is not to rail at the whole system, but to correct and strengthen it.

Since the year of McKinley's election, the number of inspectors and special agents employed by the Federal Government in its various departments and bureaus has been increased from 160 to more than 3,000. With these figures for his text, Chairman Tawney, of the House Committee on Appropriations, preached a sermon on bureaucracy recently, at Gettysburg, Pa. "The States to-day," he said, "seem not only inclined to allow, but in many instances are anxious voluntarily to surrender, to the Federal Government, the discharge of duties and the exercise of powers reserved by the Constitution to themselves, especially when the exercise of those powers and privileges involves the expenditure of money." It is an impressive list that he read of policies which illustrate this tendency, from the national quarantine law to the Federal investigation of the business methods of private corporations. Yet we fancy that a respectable

list could be made, by way of rejoinder, of tasks which the States are doing for themselves now, after years of neglecting them. Mr. Tawney himself was accused by the People's Lobby last winter of attempting to weaken the Pure-Food law by an amendment to the Agricultural bill, forbidding the payment of Federal salaries to inspectors already employed by States, counties, or municipalities. It was admitted that the enforcement of the new law would have been almost hopeless, but for the help of State and local machinery already in existence. The enormous increase in Federal activity is quite patent; but more of this is due to work never done at all before than to functions surrendered by the States.

"The Jamestown Exposition ought to be exposed. It is important that the truth in unmeasured terms be told about the monumental failure at Norfolk." Thus writes the *Army and Navy Register* editorially. And it expresses accurately the feeling of both services when it adds: "The army and navy and Marine Corps, including the cadets from Annapolis, are made to do duty as a side-show to an otherwise unattractive, unedifying and uninstructive conglomeration of arrested architecture and placarded vacancy." The *Army and Navy Journal* has also protested, not vigorously enough, however, to please a naval correspondent, who writes to its editor: "Your editorial on the Jamestown fizzle was defective only where you hesitated to tell the whole truth. There never was a more dismal failure than this thing. What angered our officers and made us blush for our country was the manifest intent of using not only our navy, but all visiting ships, as an advertising scheme to exploit a gang of greedy money-makers." But that is all that there has been to the Exposition from the start—this desire to make money out of the American army and navy, and even the President of the United States. From New York to Washington the fields are disfigured by Exposition signs bearing the pictures of a soldier and a sailor—but no reference to anything else.

President Eliot has had the hardihood to point out that Harvard's non-success in athletics has in no wise interfered with her growth, or her high position in the estimation of those parents who choose a university for its educational opportunities. There is Johns Hopkins at Baltimore, one of our most useful institutions. Few know or care whether it has a baseball nine or football eleven. It really has them, and a lacrosse team as well. But no one would think of travelling to Baltimore to see a game between Johns Hopkins and Harvard, if they should chance to meet. Yet the former continues to graduate excellent doctors of medicine and exceptionally well-trained students, whose object is to acquire knowledge while at Baltimore, rather than be amused by intercollegiate games. President Eliot also spoke out sharply against the professional coach. Harvard has yielded to the undergraduate demand for professional coaches in the hope of ending her long series of defeats on the water. She triumphed over Yale last year, but has already been beaten by Columbia and Cornell in this season. Not even professional coaches will, we believe, assure Harvard a full share of victories, so long as studies there are valued more than sports, and the men are not willing to make the sacrifices demanded by athletics.

At the commencement exercises of the Jewish Theological Seminary, Dr. Cyrus Adler proposed last Sunday the establishment of a Hebrew university. This, it was explained, would include all the leading Hebrew institutions of learning, which thus, instead of being rivals, would coöperate for a common end. The plan is to found a university after the German model, with the already existing theological school as one of the faculties. So far as endowment is concerned, the large number of wealthy and intelligent Hebrews who take a deep interest in education would assure the success of the undertaking. As for the teaching staff, the supply of learned Jews resident in America is practically unlimited. To many, however, Christians as well as Israelites, it would be a cause of regret that unnecessary emphasis should be laid upon race differences. The Jews have done a great deal for American education, in scholarship as well as in endowments. To Columbia, for example, they have been most generous. Several Jewish scholars of distinction are on the faculty, and among the graduates are to be numbered some of the most intellectual and progressive rabbis. At several other universities the race is honorably represented; hence the establishment of a distinctively Hebrew university would seem to be unnecessary.

The time having apparently come when neither belief nor authority suffices to keep the denominational sheep within the fold, new expedients are in order. Of all these we have seen none more inviting than the proposals of the Rev. A. V. G. Allen in his recent volume, "Freedom in the Church." His purpose is to show that, the articles of the creed having been adopted at different epochs and variously interpreted by different theologians of equal authority, there need be no uniformity among those who subscribe to it. He even waxes scornful at the "man in the street" who presumes to have an opinion on matters theological, or to criticise clergymen. So, too, Dr. Allen is indignant at the idea that when a church calls a minister it has a right to hold him accountable for the creed which he professes. "Honesty in the recitation of the creed is by no means the only question. Deeper motives lie beneath the present disturbance than can be measured by the uncritical observer." Dr. Allen writes his treatise with such skill that it is difficult to see how any churchman cannot find in it precedents for believing anything he chooses. Nevertheless, as if he feared that he had left some loophole by which somebody might indulge in the mild exhilaration of heresy, he says, at the end: "There is a rubric of the English book before all the creeds—Apostles', Nicene, or Athanasian—that they may be 'sung or said.' . . . If they are sung, they pass into the rank of the great hymns, the Te Deum and the Gloria in Excelsis, where misunderstandings disappear." Here, at last, is the heresy-ridder and doubt-dispeller for which troubled theologians have long been praying! Dr. Holmes commended silence as a poultice to heal the blows of sound: Dr. Allen's specific is a song to heal the discords of speech. If your Unitarian has trouble in accepting the Trinity, politely request him to sing those clauses of the creed, and you will make a Trinitarian of him at once. Agnostics, Turks, and other infidels can be brought in this way to a rapid and painless conversion.

In the cruel war that has been raging among nature-lovers we suggest that the animal psychologists would do well to enlist the services of their natural allies, the child psychologists—especially such as are capable of producing stories like "The Apple of Discord," in the May *Century*. It is about a small boy, who, having seen his father appropriate and devour an apple at the grocery, proceeds himself to steal a box of candy. Result: Mother, heart-broken; father, horrified; small boy, much depressed; perplexed as to what it is all about; also, noncommittal. The stern father decides to dress the boy up as a little girl, in order properly to humiliate him, take him to the grocery, and make him beg the forgiveness of the proprietor. This the boy, now also heart-broken, but still both puzzled and dumb, does; and incidentally whispers in the grocer's ear a tearful plea that his father shall not be put in jail because he stole the apple. *Dénouement:* Father gets down on his knees to small boy, calls him his "little man-child," and otherwise wallows naked in gush. There is a clear similarity between this kind of child psychology and the animal psychology which gets its portrayers elected to the Ananias Club. For example, Mr. Roberts has a story ("The Decoy") about a

wild goose, which a hunter had crippled by breaking its wing, and then tethered in a pond as a stool for other geese. The innocent decoy played his part perfectly until he discovered what it really was, and then struck, righteously refusing to perpetrate the base and murderous deception upon his fellow-geese. So far as we are aware, the boy has not been identified; but Mr. Roberts declares that the goose story is true, and intimates that he knew this particular goose personally. At any rate, we maintain that the respective biographers of the boy and the goose could fight with good heart, and, if need be, die, under the same banner.

That the English Government would drop incontinently the Irish Council bill, after the Irish themselves had spurned it, was foregone. The Prime Minister's announcement to that effect in the Commons Monday, simply shows that the Irish, who went in for a policy of all or nothing, will get nothing. Even the Irish university scheme will be abandoned for the present. This is really a severe blow to Irish hopes. Mr. Balfour has long favored the creation of a great Irish university, to respond to national aspirations; Mr. Bryce, while Chief Secretary, warmly espoused the plan; and it looked as if the large work might be undertaken in a conciliatory spirit. But the impatient Irish have now upset the apple-cart, and spilled out the university along with the Irish Council. Of course, the result is disheartening to Liberals, who have troubles enough of their own. In Campbell-Bannerman's statement Monday there was little that is either aggressive or hopeful. This year, there is to be no autumn session; the party has no stomach for a long fight of that kind. Consequently, a whole series of bills must be jettisoned. The Premier declared that he would bring in, before the month ends, a "resolution" on the subject of the House of Lords; but unless the Liberals manage to get a taking issue against the upper chamber, they may "resoloot till the cows come home" without producing any result except laughter in the Lords and cynical outbursts from Balfour. All told, the Liberal prospect is clouded. A sweeping measure of land reform may improve the outlook; but the chances seem good for slow disintegration of the Liberal majority, with steady loss of prestige.

Shortly before its adjournment, the Reichstag received from the Chancellor a full statement of all the cases of official misconduct in the German colonies, or at least all of those which have attracted public attention. All told, there are twenty-seven cases recorded for the last seventeen years. In that period, more than 2,000 military and other officers have been on duty in the colonies. In these twenty-seven cases there were only five which resulted in criminal court proceedings, and in four of them there was a conviction. In all the other instances, except nine, disciplinary measures were taken by the Government or courts-martial, and in one of these nine death saved the offender. On its face, in view of climatic conditions and the well-known demoralizing effect of life in the tropics, the Government feels that this record is very creditable. And so it would be if one could be sure that it really included all the wrong-doers. How many such escaped publicity or resigned in time, no one can estimate. Moreover, the name of a single offender may mean hundreds, if not thousands, of petty wrongs and tyrannies. There was the case of Prince Arenberg, for instance; he committed several murders and was guilty of a number of frightful cruelties. He was tried, but was acquitted on the ground of insanity, and is now spending his time in a luxurious insane asylum. The public expects at any date to hear of his discharge as "cured." On the whole, there is no special reason for satisfaction in this roll-call of the guilty or the accused.

Kaiser Wilhelm adds to his many other accomplishments skill as an artist and art critic. In a book just published in Berlin, Professor Seidel, curator of art in the royal palaces, praises the sovereign's activity in "church architecture, forestry, landscape gardening, genre painting, stage decoration, and the applied arts." If he indeed is proficient in all those branches, it can readily be understood that he has no time, even if he had the inclination, to disturb the peace of Europe. As a critic, his taste is catholic, although at times he is severe in his judgments. While he has no prejudice against impressionists, he "hates still life and uninteresting subjects which lack movement." His opinions are given at random, sometimes in the form of marginal notes. When some South German amateurs undertook to decide what kind of monument should be erected for Wagner in Berlin, the Kaiser signified his displeasure by writing "nonsense" at the end of one of the articles. Not even a Winckelmann could have expressed an æsthetic opinion more concisely and forcibly. But, if the royal connoisseur wishes to cure any German artists of the still-life painting habit, he might send them over to Washington for a brief visit.

A Lisbon dispatch last week spoke of the introduction of an absolutist régime in Portugal following upon the dissolution of the Cortes without any date set for new elections. A royal decree has been issued "granting subsidies and increasing the salaries of civil servants," and King Carlos is said "to visit the military barracks daily." All this evidently scents the fear of revolution. In fact, the republican propaganda in the kingdom has been for some time active enough to give justification for the gravest fears. We had brief notice some time ago of an unsuccessful revolt among the officers of the fleet, having for its object the overthrow of the monarchy. The present crisis began with disorders at the university of Coimbra, culminating in the wholesale secession of the student body to Lisbon, where their arrival supplied an impetus to the republican agitation. The question was brought up in the Cortes, and the Liberal-Conservative Government found itself blocked by the obstructionist tactics of the Progressist minority. Thereupon the Chambers were dissolved, and the University of Coimbra, the Technical College, and other higher institutions of learning, were closed. Inasmuch as the Chambers were dissolved before the budget for the year 1906-07 had been approved, the Government is now acting in direct contravention of the Constitution, which forbids the maintenance of more than one provisional budget. To win the support of the masses from the republican movement, the Government announced a series of concessions—an increase of salary for State employees, tariff reduction, a law upon viticulture, and an old-age pension law—of which the grants mentioned in this recent dispatch are evidently the first to be put in force.

"The sea-serpent of diplomatic reports" is the name that has been given to the project of building a railway from Constantinople to Bagdad. But the plans are now perfected, and, it is confidently predicted, will be carried out. The Germans obtained from the Sultan in 1902 a grant of the proposed line for ninety-nine years. When completed, the road will put Constantinople into communication with the Indian Ocean, by a route far shorter than any other, and which may rival the Suez Canal as a way to certain parts of the Orient. The engineering difficulties are great, but the new railway will accomplish the military unity of the Ottoman Empire, and will develop a country rich in agriculture as well as in coal and petroleum. M. Dubief, writing in the *Revue Bleue*, attributes the success of Germany in this enterprise to the popularity of the Emperor at Constantinople. When all other European Powers were exacting in their demands upon the Porte, the Emperor stood aloof. M. Dubief, while admitting that France is disappointed, thinks there will necessarily be great publicity in an undertaking so important to European interests.

THE PRESIDENT'S "PRACTICAL" SPEECH.

It has been said of the Bible: "This is the book where each his doctrine seeks, and this the book where each his doctrine finds." In this respect, however, the Bible must yield the palm to President Roosevelt's speeches. They are probably the finest examples of the wedding of opposites, and the vehement assertion of contradictories, ever penned by man. The result is that each reader finds in them what he desires to find. Another result is that they are subject to the most conflicting interpretation. Thus, the views taken by the leading newspapers of his Indianapolis speech, last Thursday, differ radically. In one we discover that the President is "aggressive"; in another that he is "reassuring." Here we learn that he is planning new and terrible attacks upon the railways; there we discover that he has taken fright at the consequences of his policy, and has abandoned it. These diverse and even irreconcilable impressions, made by a single speech, may show that Mr. Roosevelt is myriad-minded, or that he is unstable-minded; but they illustrate his method. There was never his equal for ability, in one and the same address, to dispute on either side, confute, change hands, and still confute.

Still, in our judgment, there is no mistaking the President's main drift. On his course, he tacks with bewildering frequency, and appears to be going in all directions; but, on the whole, it is clear that he is trimming his sails to the prevailing wind, and does not mean to battle with the strong tide now running. In a word, as one who classed himself with Harriman as a "practical" man, as a confessed political opportunist, Mr. Roosevelt has found that the times call for caution and moderation, and accordingly he is trying to appear cautious and moderate. He perceives that there is widespread financial uneasiness, and he endeavors to apply palliatives. With a threatened crop-shortage, he feels that the public is in no mood for rash experiment, and so he suddenly blossoms out as a conservative. In what he says about the crying need of railway enlargement, with its demand for private capital; and in pointing out that this private capital cannot be had without the prospect of a reasonable return and protection from Socialistic legislation, he makes himself almost a verbal echo of Hill, Harriman, and other railway presidents. He no longer finds, as he did in his annual message last December, that the predictions of trouble in railway financing are "amusing." They are now a sobering reality, and the President shows that he has been made anxious by it.

The net effect of the President's speech is that the times have changed, and that Theodore Roosevelt has changed with them. Of course, he is valiant in affirming that his purpose is "unalterable"; and asserts that he says now only what he has "always" said. But always is as dangerous a word for a politician as never. What are the facts? The President now declares that there has been "much wild talk" about the over-capitalization of American railways. In his opinion, there is practically no over-capitalization, since the "real value" of the railway properties is, he thinks, greater than the "face value" of their securities. But in his message last year, he spoke of "the evils of excessive over-capitalization," as if they were admitted by all; while in 1905 he mentioned over-capitalization as "perhaps the chief" of all the "abuses" which he aimed to correct. A man may change his mind when he finds that he did not know what the facts were; but it is not even a skilful manœuvre to cover a retreat, when the command for about-face is given, with the words: "All this is what I have said over and over again."

In some quarters there appears to be much excitement over an *obiter* in the President's speech. In a casual way, he said:

> In so far as the common carriers also transport the mails, it is in my opinion probable that whether their business is or is not interstate, it is to the same extent subject to Federal control, under that clause of the Constitution granting to the national Government power to establish post roads, and therefore, by necessary implication, power to take all action necessary in order to keep them at the highest point of efficiency.

This is held up as a new scheme of Mr. Roosevelt's to break down the power of the States, and to put the Federal Government in direct charge of every street-car carrying mails. It is pictured as an alarming hint of the kind of seizure of power "by construction," to the possibility of which Secretary Root referred in his much-discussed speech, some months ago. But we do not think anything of the kind will be really attempted. We have no idea that, if it were, it could be done. The disquieting thing about the President's lugging in of such extraneous matter is that it indicates a certain flightiness. A well-balanced statesman would not venture to throw out so dubious a suggestion in a public speech. He would weigh the thing carefully; take advice; consult lawyers and judges; and even then would not be so cocksure. But what Mr. Roosevelt thinks about he talks about; his half-formed ideas he blurts out, feeling that because they interest him, they must other people. This "thinking out loud," as Mr. Root called it, is an old habit of the President's; but it surely was never displayed to so little advantage as in this jaunty and wholly unnecessary offering of a judicial opinion in favor of a very strained interpretation of the Constitution.

In the main, however, it is clear that the President intended to allay the apprehensions which he has excited. The many appeals to him to say something to soothe the feelings of capitalists have their answer in this speech. It amounts to saying: "If you thought I wanted financial trouble during my Administration, or that I did not know how disastrous would be its political effects; if you thought I was fanatically convinced, like Bryan, instead of being merely bent on the advantage of the hour, you now see how greatly you were mistaken."

THE NATIONAL GUARD INQUIRY.

The investigating committee appointed by the New York Legislature to study conditions in the National Guard has practically unlimited powers. If our understanding is correct, it can inquire whether Private John Smith has been doing his duty, or whether the humblest employee in a Buffalo armory is being overpaid. So broad is the scope of its investigation that it is highly important that its members should fully realize the extent of their opportunity. Of their peculiar fitness for the task in hand we have full assurance; it is hard to see how the personnel could have been bettered. But they understand, we hope, that they would fall far short of public expectation if they should confine their investigation to the question of armory graft, or to the relations between the Adjutant-General and Major-General Commanding. Theirs is the chance to do a solid piece of constructive work—to lay, perhaps, the foundation for reorganization, and to influence Federal and State legislation for years to come. For whatever is done by them is certain to be imitated in many other places.

A perception of the unusual character of the inquiry was shown by a member of the Commission, who remarked that there was actually no precedent in this country for its proceedings, and that it could only be likened to Lord Usher's recent committee on the British auxiliary forces. The truth is that our National Guard system has developed in a purely haphazard way; its very name is a misnomer, and the functions and duties of the State troops in war time have long engaged the attention of our greatest Constitutional authorities. For about a hundred years Congress paid practically no attention to the militia; after the war with Spain it passed the Dick law, the object of which was to bring the State troops into close relations with the War Department, and make them of immediate avail in time of war with a foreign enemy. During the long period between the civil and Spanish wars, the National Guard improved steadily, if slowly, always fol-

lowing in the footsteps of the regular army to the extent, at least, of imitating its numerous uniform changes. The number of troops was cut down; paper regiments were done away with, the encampment periods lengthened, and practical field exercises introduced. In short, the fuss and feathers of the old militia training days have gradually disappeared, particularly in this State.

On account of the changed attitude of the Federal Government towards the State troops, the Sanger Commission, as we presume it will be called after its able chairman, will find, if it goes deep enough, two prevailing schools of thought. One, backed by all the influence of the Federal Government, is for making the National Guard merely a reserve for the regular army; the other remembers that these are State troops, primarily maintained for the purpose of preserving law and order within our State boundaries, or at most performing similar duty elsewhere at the call of the President, as did the Seventh Regiment in Washington in 1861. The present commander of the State troops, Gen. Roe, represents, it seems to us, the State idea. He is much less interested in making a poor reserve than in creating a body of civilian soldiery peculiarly efficient in such duties as they were called upon to perform at Buffalo, in Brooklyn, and at Croton, when summoned for strike duty. He cares nothing for brigade exercises or division manœuvres; he does lay great stress upon the efficiency of each unit, and he desires more cavalry and less artillery, for the former is of the greatest value in riots, and the latter of very little save in great emergencies.

Whether the Sanger Commission can reconcile these two theories remains to be seen. For ourselves, we sincerely hope that the State idea will remain uppermost, if for no other reason because we believe that an effective reserve to the regular army can be built up only on totally different lines. Recruiting the militia is difficult enough; there are very few attractions for the ordinary enlisted man. If the Federal idea is to prevail, and the physical standards of the regular army, recruiting will be difficult indeed, and the State will lose the services of some of its ablest young citizens for minor physical defects of no importance in National Guard service. Already there is grave anxiety as to the effects of the Dick law, which finally comes into force on January first next, and which insists, for instance, that each company must have only eighty-four men, though many of our companies have a hundred. Failure to comply with the law is punished by the withdrawal of Federal financial support. How troops in North Carolina and South Dakota are going to comply with the law—to say nothing of New York—remains to be seen.

So far as local military problems are concerned, there are plenty of them for the Sanger commission to consider. It ought to recommend the ending of the election of company officers by their men, and of field officers by their subordinates—a practice excusable, perhaps, in 1807, but, in 1907, at the bottom of endless regimental quarrels and dissensions, and responsible for much laxity of discipline. It might well decide that the offices of adjutant-general and major-general commanding should be consolidated, or that we should make experiment of a chief of staff and an adjutant-general. The Commission must not overlook the fact that the cities build the armories and the State controls them; the Legislature often making laws about them at the behest of politicians, in flagrant disregard of the wishes of the military authorities. It will find that there is no systematic instruction of officers, and that the proportion of infantry to cavalry and artillery is in need of adjustment. Finally, if it is candid, it will report that the attempt to make valuable coast artillery out of militia troops is hopeless.

KARL BLIND AND HIS TIME.

The death in London of Karl Blind at the advanced age of eighty-one removes the last of the notable figures of the German revolution of 1848-49. Kinkel, Hecker, Hartmann, Schurz, Mieroslawski, Bamberger, Freiligrath, Willich, Karl Marx Sigel, Blenker, Kapp—a whole host of others of greater or smaller fame, have passed away, enthusiastic believers in liberty and democratic institutions to the end. Here and there still survive men who as mere boys took part in what was as pure and idealistic an uprising as any country ever witnessed. But of the leaders that have now gone, none held out against the Prussian monarchy and the Imperial government more obstinately than Karl Blind. He never returned to Germany; but political events there he watched with as keen an eye at eighty as at twenty, and his comments on them in the English magazines were invariably illuminating.

Reviewed now, Blind's career reads more like a romance than an historical record. Educated at the Universities of Heidelberg and Bonn, he was five times imprisoned, because of his political views, between his nineteenth and twenty-first birthdays. Captured at the battle of Staufen, he was court-martialed and saved from death only by a flaw in a proclamation of the Grand Duke of Baden. Eight months' solitary confinement, at first in chains, followed; then another uprising of the people freed him in time to become a member of the revolutionary government; and later its minister to France. There he was again arrested, in violation of the law of nations, but after two months in jail was merely banished. By that time most of the South German exiles had found a refuge in London or in Switzerland, and from the home Blind established in the British capital he coöperated with Mazzini, Garibaldi, Ledru-Rollin, Louis Blanc, and other European leaders; for the revolutionary movement of that day knew no national boundaries among its advocates. The Schleswig-Holstein movement he naturally aided, likewise the Polish uprising of 1863-64 against Russia. The American civil war left him not a moment in doubt; his sympathies went out at once to Schurz, Sigel, Hecker, Blenker, and Willich, who were so quick to don the Federal uniform in behalf of the enslaved African. In short, wherever men thought or battled for freedom and against despotism, Karl Blind worked for them and cheered them on.

In Carl Schurz's recently published reminiscences, in *McClure's Magazine*, the spirit which actuated the "48-ers," as they are still known throughout Germany, has been well described. The names of Franklin and Washington were lode-stars by which they sought to steer their course. At the great *Demokratenfest* in Mayence, on February 24, 1849—a bold celebration of democratic beliefs and an avowal of faith in republics and their underlying theories—the world-wide character of the revolution was clearly recognized. Fröbel himself toasted "the revolution, which includes all European peoples, which brings nourishment to the starving Irish in the West, and loosens the chains of the serfs in the Ural, which makes in the south citizens of the *lazzaroni*, and brings the conception of liberty to the North." Yet an easy victory was nowhere expected. Ludwig Bamberger on this same occasion said boldly: "We cannot triumph now. An ocean of tears of blood still lies between us and the new land of freedom." When the ill-armed forces of the people were scattered like chaff by the Prussian troops, it was but natural that the majority of the leaders who survived should have sought freedom on this side of the Atlantic, little dreaming that within twelve years they should again be taking up arms for their belief that all men are free and equal.

History has not yet fully set forth the value of the services rendered by these men to the Union. It is not merely that every German regiment that went to the front had one or more of them among its officers; that Hecker, the most prominent of all the revolutionary leaders of 1848-49, commanded the Eighty-second Illinois and Willich the Thirty-second Indiana, and that Schurz, Sigel, Blenker, Steinwehr, and others were general officers. More weighty than this was the worth of their example, the lofty patriotism they displayed, their devo-

tion to the republic and all it stood for, their readiness to pay their debt of gratitude with their lives after only ten or eleven years of residence. They were not soldiers of fortune, but men of conscience, and as such their prompt response to the call for aid was of immense moral value to the Washington Government. In this day and generation, when the tendency is to restrict more and more the immigration of foreigners, this debt of the United States to some of its immigrants cannot be recalled too often.

What the loss of such men as Blind and Schurz meant to Germany, even Bismarck was able to see, and he expressed his regret at it more than once. Bamberger remained in Germany, and as a Liberal member of the Reichstag rendered services of great value, fighting always for the doctrines of his youth. Had there been more like him, it is at least questionable whether the democratic movement would have been so completely pushed aside by the Socialistic as is the case in Germany to-day. Somehow or other, if there is to be real progress there and elsewhere in Europe, there must be a revival of the moral enthusiasm and the idealism of Karl Blind's time. In their recurrence, we believe, his faith no more faltered than did that of Schurz. He who drinks as a young man such draughts from the cup of liberty as did they, never wholly loses the effect of the stimulant. And Blind lived long enough to see the first trial of popular suffrage in Austria, to witness the people of Russia stirring mightily, quickening to the old-fashioned doctrines of a popular parliament, and no taxation without representation. This surely must have revived his faith, had it failed him in view of the absence of any Republican movement in Germany, as it must hearten every true believer in democracy the world over.

WHEN HOMER NODS.

An English newspaper, in commenting on Mr. Bryce's recent speech at Jamestown, called attention to an erroneous statement therein which it thought might be due to a blunder in telegraphic transmission, but in any case curious enough to be made a text for commenting on mistakes made by men who know much better. Mr. Bryce was reported as saying that in 1607 "Sir Walter Raleigh was a man of fifty-five; Sir Philip Sidney was a man of forty-nine; Pym a youth of seventeen; Hampden a boy of seven; Cromwell a boy of eight." Whereupon the English journal remarks that "it is scarcely conceivable that any one could forget the circumstances of Sidney's heroic death at Zutphen more than twenty years earlier, or could include him among the eminent figures of the court of James I." But there are excellent precedents for the blunder, if it actually was made. One explanation lies in the existence of what has been called an "idiotic area" in the brain corresponding to the "blind spot" in the eye, which renders one strangely insensible not only to slips of the tongue, but to glaring errors in manuscript and proof.

Guy de Maupassant, in his introduction to the works of Gustave Flaubert, quotes extensively from a huge scrapbook of bulls, errors, sillinesses, and crudities which the latter had passed many years in compiling from the writings and speeches of the great men of all times. It was not mere pastime for Flaubert, but a serious documentation for the study of irony. Having shown the illusory nature of passion in "Madame Bovary," of political power in "Salâmmbo," of faith in "La Tentation de Saint Antoine," of civic peace in "Bouvard et Pécuchet," and of civic training in "L'Education sentimentale," he took delight in heaping up a monument of testimony to the weakness and treachery of the human intellect itself. Flaubert pursued the scholastic method of quotation and comment; of the scores of examples that his pupil quotes we may take one as typical. A distinguished writer of the classicist school had been elected to the Academy, and in his inaugural address argued for the thesis that literature should not concern itself with the sensational event of the moment. Flaubert quotes his words: "Did Molière, did Corneille, find it necessary to put on the stage the Revocation of the Edict of Nantes?" and comments, "Molière died 1673; Corneille died 1684; Edict of Nantes revoked 1685."

"It is scarcely conceivable that any one could forget the circumstances of Sidney's heroic death at Zutphen." That is just the point. The youngest of us knew very well the story of Sidney, wounded to death, removing the bottle of water from his parched lips to hand it to a dying soldier. Not only that, but Mr. Bryce probably knew just how much credence should be lent to Fulke Greville's account of the incident, and could point out passages in the "Arcadia" laudatory of just such acts of chivalry. But is there anything novel about the investigator of the theory of pure number who cannot subtract with acceptable accuracy, or the Shakespearean scholar who cannot remember the name of Hamlet's uncle, or the writer on rhetoric who trips up on the spelling of "queue"? Authors can never be depended upon to read their proofs well, for the reason that in the parts they are fond of, emotion, plus vivid memory, makes them blind; while in the parts they are deadly tired of, indifference makes them equally blind.

Psychologists have studied and tabulated the whimsicalities of the "idiotic area" which makes us not only blind, but deaf and halt. The specialist in palæography, proceeding on recognized principles, can thus confidently go on correcting the mistakes of some scribe of a thousand years ago who wrote *nobis* when he should have written *vobis*, because *nobis* came on the preceding line, or put "Aetius" for "Stilicho" for the same reason. There are errors of transcription which occur with regularity and have been classified under such formidable heads as haplography, dittography, etc. Poe heard the whispered word Lenore because he was quite ready to hear it, just as children and visitors at spiritualist *séances* see ghosts, and German metaphysicians, in moments of intense abstraction, drink vinegar for water and find it good.

All writers who create large galleries of portraits occasionally mix them up; or if they write long novels, forget towards the end what came at the beginning. Balzac, if we are not mistaken, is guilty of writing Rastignac when he meant De Marsay, and Thackeray was continually confounding his Philips, Pendennises, and Warringtons. Sir Walter Scott had it called to his attention by his printer that it was wrong to say "the cutler replied," because he had made that person go downstairs some time before; and corrected his proofs to read, "the cutler, who had in the meanwhile reëntered the room, replied." It was Mark Twain's bitter complaint against James Fenimore Cooper that he permitted a ninety-foot houseboat descending the Susquehanna River to take curves fifty feet in length.

THE SKIRTS OF FAME.

If we may judge of the bulk of Mark Twain's half-million-word autobiography from the parts that are appearing in the *North American Review*, the name of Susan Clemens is destined to some share of the immortality that awaits Tom Sawyer and Huck Finn. The extracts from "Susy's Biography of Me" are quite as gripping and illuminative as anything in the great philosopher's ripe recollections of himself. Unless, indeed, the paternal hand has added its own touch to the material, Susan had her full portion of the hereditary humor and power of insight, and her contributions to the autobiography are sufficient to give her complete title to the rank of collaborator. On the other hand, Mark Twain's fourteen-year-old daughter, on whose memory he continually dwells with such poignant regret, could have found no more acceptable editor and publisher than her father, who has opened his pages to her as freely as the pages of the world's books and magazines are open to him.

Very few of us are in the happy position of being able to raise a monument more lasting than brass to the memory of some unknown dead, or to bring fame

to the deserving and living obscure; and those who are in the position to confer fame, by virtue of a safe and commanding place in the world of letters or art, carefully abstain from doing so. The literary professional is so much of a parasite on other people's thoughts and phrases that he dare not name his victims under penalty of dimming his own reputation. The historian's fair name does not suffer because in his footnotes he assigns credit where it is due. But how many essayists would be courageous enough to state in parentheses, "This brilliant observation was made one day by Mr. Jones, a very dear friend, who has given me permission to make whatever use of it I choose," or, "This point was suggested at dinner one evening by Mr. Smith, whose engagements in Wall Street do not allow him sufficient leisure for personally developing his very incisive views on the Spanish drama." What novelist would venture to confess at the end of a chapter that "the dramatic situation on pages 44-48 is largely the work of a kindly critic and companion, Miss Robinson, who, on seeing the original manuscript, suggested that, instead of making Venango kill Gaspard, I should have Gaspard kill Venango." Now and then a particularly conscientious author will write, "Some one has cleverly said," or, "I have read in a book that I have since forgotten——" Forgotten; some one! There is the rankest denial of justice to one whose claims to a share of the author's reputation any court would allow.

It is not so much the man or woman who occasionally utters something worthy to be perpetuated that has reason to complain. There are undoubtedly thousands of potential authors in this country at the present who are silent because of some form of literary agraphia—laziness, lack of the power of concentration, or horror of the pen. People who will talk brilliantly at dinner or discourse on deep themes during a walk in the country, fall into a cold sweat when you ask them why they do not occasionally write down the things they "get off" with such apparent ease. And their horror of the pen proceeds from a superstitious reverence which is ridiculously widespread. What! Actually see one's self in print? At the very idea of giving written form to their daily thought, that thought grows palsied with mistaken humility, with actual cowardice. "You take it and write it up"—"you" being a professional literary chap—pleads the victim; and the literary carpenter makes no bones about accepting the offer and posing as a source of inspiration and germinating bed of ideas, whereas he is only a clearing-house. Our mute, inglorious Miltons are not silent because they cannot spell correctly, but partly because they would rather play golf, and partly because they don't understand that the making of much of literature is like the making of chairs—dictated by the necessity of earning a living.

And yet, if the professional writer would but get to see it, the adoption of some such system of giving a due meed of fame to those who cannot conquer it for themselves, would immeasurably enhance the author's position. The man whose book commands attention would be welcome in every house, not as a mere celebrity to flaunt in the eyes of our neighbors, but as one in whose power it is to raise whom he will, by a kindly allusion, a sympathetic foot-note, or well-turned dedication, from the level of the street to Olympus. If Homer, in exchange for a flagon of wine and a side of roast sheep, endowed his host with immortality by placing his ancestors among the heroes who came to Troy; if Dante did not think it beneath him to insert the name of his benefactor, Can Grande, into the text of his immortal poem, it surely would be no disgrace for one of our moderns to go a step farther, and, after mentioning his friends' or his patrons' palaces, yachts, stocks and bonds, automobiles, and ancestors, perpetuate even a remark or two made by his host or hostess at a moment of inspiration.

The world at large would surely profit by having such minor accretions of merit embedded and preserved in the larger fame of those whose business it is to write. It raises the general estimation of human progress to think that for every book we have in print, ten authors thought and felt and aspired. How many charming people have we not come to know, because they wrote letters to Robert Louis Stevenson or Balzac? How many an old historian would have been lost to us, as a man, if Cyprian or Jerome, in quoting his fragments, had referred to him as "some lost Pagan"? What would lovers of all subsequent ages have done if Longinus had spoken of "a certain lady writer from the island of Lesbos," instead of Sappho?

BIBLIOGRAPHICAL NOTES ON DEFOE.—I.

I desire in these notes to analyze, in the light of some recent investigations, the more or less standard list of Defoe's writings prefixed to the first volume of William Lee's well-known work, and also, despite the fact that Defoe is already enrolled among the most voluminous and versatile of all British writers, to point out a rather large number of items, chiefly pamphlets, which in my judgment should be definitely ascribed to him. I wish furthermore to enlist the interest of bibliographers and collectors and students of the period in order that I may profit from their corrections and suggestions before I publish in approximately final form the bibliography I am preparing; and to secure, if possible, through their assistance access to a number of rare items, that have thus far eluded me.

Before entering definitely upon my task, I may say that, as often happens, I began only with the intention of dipping into the subject, soon found myself getting deeper and deeper in, and at last was completely over my head. If there now seems to be some chance of my emerging, this is due to the fact that I have been able to use freely many of the largest libraries in this country—particularly that of Yale University—as well as the Bodleian and the British Museum, and that I have received invaluable aid from scholars and collectors—especially from George A. Aitken, Thomas J. Wise, and Prof. H. S. Foxwell, who generously lent me manuscript lists of ascriptions and gave me access to many rare tracts. Numerous memoranda made by the late James Crossley were put at my disposal by Mr. Aitken, and fully half of the additions I shall propose are due to suggestions found in these papers. The remainder of my proposed additions fall chiefly under three heads: (a) pamphlets read without previous suspicion of Defoe's authorship, and found through stylistic analysis and the following out of a variety of clues and tests to be indisputably or most probably his; (b) tracts ascribed to Defoe in the catalogues of libraries, yet either overlooked or discarded by Lee; (c) pamphlets laid at Defoe's door by contemporaries such as Boyer and Toland, but rejected by Defoe's biographers on the score of his own disclaimers or of lack of consistency with his acknowledged or well ascertained writings.

In the case of the last-named group my acceptance of items usually discarded has been due to the fact that I have been forced against my will to come to the conclusion that Defoe stuck at nothing when he wished to evade a charge of authorship, and that he was quite capable, as his enemies asserted, of writing on both sides of any question. For about two years I preserved some of my faith in the Defoe of the biographers—the veracious and consistent and high-minded writer on public affairs, and I could have preserved a modicum of confidence to the end had it been only a question of resisting the evidence of his duplicity afforded by a few pamphlets not absolutely proved to be his. But when the application of numerous and very minute tests—which cannot be described here—invariably brought me over to the side of the contemporaries who attributed the tracts in question to Defoe—to the number, let us say, of fifteen or twenty—and when, without expecting it at all, I was led by these same tests to attribute to him new tracts plainly written to uphold causes and men he had shortly before denounced, my belief in his integrity was shattered, and I regretfully yielded to the conviction that his journalistic rivals knew his character and his ways far better than any of his biographers. I came to the conclusion also that the tradition that he had been known on occasions to write two rather long pamphlets in one day, was not a gross exaggeration. This tradition and the fact that most of the items I wish to add are tracts, few of them of any considerable length, should be borne in mind by persons disposed to doubt whether it is possible to supplement so extensively at this late day the bibliography of a writer so important and so much studied as Defoe.

It is scarcely necessary to add that I take no stock whatsoever in the notion that Defoe had a "double," who wrote in a style practically indistinguishable from his. To champion the existence of such a "double" is to set up an hypothesis no more explicable and certainly less credible than the phenomenal creative activity which has been a stumbling-block to comparatively sterile mortals.

But it is time to turn to Lee's "Chronological Catalogue," given in his "Daniel Defoe: His Life and Recently Discovered Writings" (1869). This "Catalogue" has been made the basis of practically all subsequent work upon Defoe—for example, of Minto's short biography in the "English Men of Letters," of Leslie Stephen's article in the "Dictionary of National Biography," and of the critical portions and the bibliography of Thomas Wright's "Life of Daniel Defoe" (1894). It contained 254 items, and included not only the separate volumes of the *Review*, but also all the other journals with which Defoe could be shown to have been connected, as well as the works to which he made contributions. The first item, "A Letter containing some Reflections, etc." (1687), was later admitted by Lee to be Bishop Burnet's. The gap is filled, however, by Lee's accidental omission of "Due Preparations for the Plague" (1722), and the list is extended by the fact that Lee concurred with Crossley and others in attributing to Defoe the tract entitled "A brief historical Account of the Lives of the six notorious Street Robbers, etc." (1726), which is included in the sixteenth volume of George A. Aitken's edition of Defoe's "Romances and Narratives" (1895). Another item would have been added by Lee had he lived until 1895, when Dr. Bülbring published the tract "Of Royall Education," which he had separated from "The Compleat English Gentleman," edited by him in 1890. We may therefore regard the standard list of Defoe's writings, exclusive of his letters (many of which were published by the Historical Manuscripts Commission in 1897 and 1899), and of such papers as the interesting document given in *The English Historical Review* for January, 1907, as consisting of 256 items. From these, for my present purposes, I subtract twenty-three items, covering all those that do not refer to books or pamphlets,* which leaves 233 books and pamphlets for consideration here. Of these, I have read in one form or another, all except three items, which, fortunately, are not supported by Lee's attribution alone. They are:

No. 47. "The Liberty of Episcopal Dissenters in Scotland truly Stated. By a Gentleman." 4to, 1703.

No. 53. "The Layman's Sermon upon the late Storm, etc." 4to, 1704; and

No. 234. "Mere Nature Delineated; or a Body without a Soul, etc." 8vo, 1726.

These all appear in Walter Wilson's list (though he had not seen the first), and the first and last were accepted by Hazlitt. I am quite certain that the last is by Defoe, for reasons that need not be given; but I should be made much more comfortable with respect to them all if I could get access to copies.

With reward to the 230 items remaining, I shall here deal only with those that are clearly erroneous or else apparently open to reasonable suspicion. The first class is very small; indeed, in view of Defoe's protean character, I am not sure that I should be willing practically to swear that Lee erred in ascribing any tract save No. 94, "A Letter to a Friend, giving an Account how the Treaty of Union has been received here," Edinburgh, 1706. This, as Mr. Aitken has already noted, belongs to Sir John Clerk of Penicuik (cf. his "Memoirs," 1892, p. 244). But I have strong reasons to believe that No. 61, "A True State of the Difference Between Sir George Rooke, Kt., and William Colepeper, Esq." (1704), was written by Colepeper, possibly with Defoe's assistance; that No. 55, "Legion's Humble Address to the Lords" (1704), for which a certain Pierce went into hiding, was wrongly fathered upon Defoe; that No. 109, "A Reproof to Mr. Clark, and a Brief Vindication of Mr. DeFoe" (1709), was actually, as it purports to be, the work of a third party, Lee not having seen another manifesto on the squabble issued by Defoe; that No. 180, "A Short Narrative of the Life and Death of John Rhinholdt, Count Patkul" (1717), was really, as the "Somers' Tracts" stated long ago, written by Lord Molesworth—a catalogue of the errors that have accumulated around this pamphlet and the German account on which it was based, would fill a page or two; that No. 214, "The Life and Actions of Lewis Dominique Cartouche" (1722), was not only the translation from the French it purported to be, but, as Mr. Aitken has pointed out, was not clearly enough in Defoe's style to warrant an ascription; and that finally, again as Mr. Aitken has noted and as Sir Walter Scott may be held to have believed, No. 217, "The Highland Rogue, or the Memorable Actions of the Celebrated Robert Macgregor; commonly called Rob Roy" (1723), has very little claim to be regarded as a work of Defoe's. Seven errors, or eight, if we count "A Remarkable Passage," etc.; of which two are declared to be such mainly upon considerations of style, is surely a small list for so tangled a bibliography.

The list of suspected items with regard to which I do not find myself on Lee's side, is even smaller. The devoted biographer went too far when he wrote in his Introduction:

> Two things, however, I desire to affirm—modestly, but with a strong assurance: That Daniel Defoe was the author of all the works I have ascribed to him; and that he was not the author of any of the works heretofore attributed to him, but which I have omitted.

Yet, although Lee erred both in his assertions and in his denials, and although the list of omissions is probably far greater than he had any idea would be the case, it remains true that his fifteen or twenty years' devotion to his favorite author yielded results which, to say the least, make the exclusion of his own name from the "Dictionary of National Biography" a matter for surprise.

The first of the suspicious items is No. 3, "The Englishman's Choice and True Interest, etc." (1694), which is possibly Defoe's, but is by no means sufficiently in his manner to warrant positive ascription. So with No. 31, the poem "Good Advice to the Ladies" (1702), which Wilson omitted on the score of an ostensible but not clear denial of its authorship made by Defoe in the *Little Review*. Personally I am inclined to agree with Lee in believing it to be Defoe's, chiefly because an apparently reputable publisher's name appeared on the second edition, but it is very rash to be positive about the ascription of a bad poem, published in the interregnum between Dryden and Pope. There are half-a-dozen or more other worthless performances that were hawked about as productions of the "Author of the True-born Englishman," concerning the authorship of which no one can afford to be positive. Defoe was capable of execrable doggerel; the pirates of the day were capable of any sort of breach of honesty. These facts render the ascription of Nos. 69, 70, 71 of Lee's list very doubtful. They are excerpts from No. 68, "The Consolidator," and were rejected by Wilson and Hazlitt as mere piracies, but accepted by Lee because they contained a little matter not to be found in the book from which they were taken or purloined. I have seen only No. 69, "A Journey to the World in the Moon" (1705), which undoubtedly has a little new matter, but nothing that a pirate could not have added. Defoe may have been responsible for the trifles, or some of his contemporary denunciations of the pirates may have had reference to these very pieces. It is a matter difficult to decide, and certainly of slight consequence.

No. 103, "The Union Proverb" (1708), is mentioned here, not because I greatly doubt Defoe's authorship, but because no one has yet, to my knowledge, explained how the trifle got a place in the second edition of Oswald Dykes's "English Proverbs" (1709). Dykes was a real person, and the tract ascribed to Defoe appears in the book without an intimation that it was not the work of the ostensible author of the volume. In style and substance it seems to be Defoe's, if we suppose that he consciously imitated the form of proverb adopted by Dykes in the first edition of his book; but it is conceivable that Dykes might consciously or unconsciously have written in the style of Defoe. It would seem that more light is needed on the matter.

The next item, No. 120, "Atalantis Major," etc. (Edinburgh, 1711), is the first tract that brings before us here the question of Defoe's integrity. It was first assigned to Defoe by Lee, apparently with Crossley's approval, upon strong internal evidence. I have my doubts whether the evidence would have seemed so strong to them if they had known that on December 26, 1710, Defoe wrote to Harley from Edinburgh, that he had got hold of a manuscript libel entitled "Atalantis Major," which he hoped to be able to suppress. He suspected a certain Englishman of being the author, but he dared not be positive. We may be positive that the tract published was the tract he saw, and that, if he really was the author, truth not only was not in him, but for some time at least had not even been near him. If we continue to assign "Atalantis Major" to him, we must be

* In these twenty-three I include "A Remarkable Passage of an Apparition" found in the compilation, "Mr. Campbell's Pacquet," etc. (No. 203). From the communications of Alfred F. Robbins to *Notes and Queries* (8th ser. viii, 221, 349) it would seem that Dr. Ruddle rather than Defoe wrote "A Remarkable Passage"; and certainly all stylistic tests point away from Defoe.

prepared to believe that he was capable of deceiving the man to whom he had vowed eternal gratitude, and for whom he had deliberately changed the tone of his acknowledged political writings. As I propose to attribute to him several tracts which show him up in an even worse light in his relations with Harley, the ascription of this pamphlet does not specially embarrass me; but I think that in the light of Defoe's correspondence their attribution would have worried the older bibliographers. I have carefully studied the style of the performance and have nothing to say but "Aut Danielus, aut Diabolus, aut ambo."

No. 127, "Armageddon," etc. (1711), is a tract which has involved me in much perplexity. On the score of the nature of the arguments it uses with regard to the carrying on of the war then in progress, a fair case might be made out against Defoe's authorship, and I have seen a copy in the British Museum endorsed in an old hand—"supposed to be writ by Mr. Asgill." The stylistic evidence, however, is so strong for Defoe that I cannot but conclude that he wrote the pamphlet. It is worth noting that "Armageddon" and "The Balance of Europe" (No. 128 of Lee) can scarcely be given to Defoe if we accept literally the statements made by him in the introduction to his acknowledged "Essay at a Plain Exposition of that Difficult Phrase a Good Peace" (No. 129 of Lee's list). I am not in the habit of accepting such statements; Lee and Crossley appear to have accepted them when they specially wanted to take sides against Defoe's contemporaries, like Boyer and Toland. Wilson seems to have been more consistent in rejecting both "Armageddon" and "The Balance of Europe," though I feel sure from both external and internal evidence that he was wrong in both cases.

No. 152, "The Scots Nation and Union Vindicated, etc." (1714), has also been attributed to Gorge Ridpath (cf. Halkett and Laing); but Mr. Aitken does not mention it in his article on Ridpath in the "Dictionary of National Biography," and there is no lack of grounds on which Lee's ascription to Defoe may be defended. It would be a pity were he deprived of the tract, for it affords evidence that its author had in his possession a list of Scotch officers who served under Gustavus Adolphus, and this fact has its bearings on a point I shall not discuss in these notes, Defoe's claim to that famous book, the "Memoirs of a Cavalier." I may add that I have as little intention of discussing the story that Harley wrote "Robinson Crusoe," or of endeavoring to clear up a slight doubt that hangs over the authorship of "The History of the Life and Adventures of Mr. Duncan Campbell."

Nos. 160, 161, and 162, to wit, the three parts of the notorious "Secret History of the White Staff," must next occupy us a moment, for there really seems to be no ground for ascribing No. 159, "A Secret History of One Year," to Sir Robert Walpole. The "White Staff" pamphlets have been attributed to Defoe ever since they appeared (1714-15), and even Lee is compelled by the evidence afforded by their style and substance to wriggle out of the plainly intended, though not frankly and clearly expressed, disclaimer of Defoe ("Appeal to Honour and Justice"), and to assign them to his hero with a tribute to his "courage and faithfulness" that under the circumstances is truly pathetic. Adequately to discuss this vexed question of authorship is impossible here, but I may say that some points which I have gleaned from Defoe's correspondence with Harley and a specially important stylistic clue, together with some charges made against Defoe in a contemporary pamphlet which has not to my knowledge been utilized by previous students, have removed every lingering doubt from my mind and have furthermore made me confident that, piqued by Harley's rejection of books designed to aid him, Defoe, as the contemporary pamphlet just mentioned charges, added what are practically a fourth and a fifth part of the "White Staff" series—to wit, "Memoirs of the Conduct of Her Late Majesty and Her Last Ministry, etc." (1715), and "The Secret History of the Secret History of the White Staff, Purse and Mitre" (1715). The former of these was attributed to Defoe by Crossley, apparently without a knowledge of the pamphlet which led me to it independently, and a copy in the Yale Library is endorsed in a recent hand "plainly by Defoe." The latter of the two pamphlets was read by Lee and utilized in his book, but obviously without exciting in him the suspicion that he was reading an attempt made by Defoe himself to treat as mere unreliable hack-work pamphlets by booksellers' tools what he had undoubtedly at first put forth as more or less authorized pleas in Harley's behalf. The stylistic evidence in favor of these two tracts is almost if not wholly as strong as that which made Lee accept the three parts of the "White Staff" series, and, after all, the substance of the additions to the series is not of a nature to make even a stanch admirer of Defoe refuse to accept them.

No. 169, a long "History of the Wars of his present Majesty Charles XII., King of Sweden," which appeared in 1715, and was augmented in 1720, did not pass unchallenged when Lee issued his catalogue, but Crossley, the greatest authority on Defoe's bibliography, supported Lee heartily. A positive verdict in the matter should hardly be reached, I think, until a careful study is made of the materials at that time available for a biograpber of Charles XII., and much the same thing may be said with regard to No. 216, "An Impartial History of the Life and Actions of Peter Alexowitz, the present Czar of Moscovy, etc." (1723). My own study of the books themselves and of Defoe's frequent references in other places to the two monarchs leads me to incline strongly to support Lee and Crossley in their attributions.

Nos. 175 and 176, "Some Considerations on a Law for Triennial Parliaments" and "The Alteration in the Triennial Act Considered" (1716), lure us into one of the worst quagmires to be found in Defoe's bibliography. In *Notes and Queries*, 1st ser., v., pp. 577-9, Crossley called attention to the fact that in *Mercurius Politicus* for July, 1716, a letter from Defoe was reprinted in which he denied writing a tract against the proposed abrogation of triennial parliaments, entitled "The Triennial Act Impartially Stated," which Boyer had laid at his door in the *Political State* a year before; and in which on the other hand Defoe claimed as his a tract on the opposite side of the controversy, entitled "Arguments About the Alteration of Triennial Elections of Parliaments," which Boyer had fathered on Addison. Crossley accepted Defoe's disclaimer of the former tract, but could not admit his claim to the authorship of the latter. His chief reasons for this position were that the "Arguments" was not in Defoe's style, and that it denounced the Bill of Commerce with France which Defoe had warmly supported in undoubtedly genuine articles and pamphlets. He admitted that if Defoe were indeed the author of the "Arguments," the charges made by contemporaries that he was willing to write on both sides of a question would be substantiated. But, believing firmly in Defoe's political integrity, Crossley was driven to frame some hypothesis that would explain the former's letter in *Mercurius Politicus* (which by the way had *named* neither tract under discussion); and this he found in the assumption that, a year having elapsed between Boyer's charge and Defoe's reply, the latter's memory had failed him and he had confounded the pamphlet praised by Boyer, to wit, the "Arguments," with one only mentioned by Boyer, to wit, that which Lee makes No. 175 of his list. No. 176 of Lee's list, which was also enumerated by Boyer and with regard to which Defoe was equally silent in his letter, is not mentioned in Crossley's discussion, but he seems to have acquiesced in Lee's ascription of it to Defoe.

For my own part I have considerable respect for Defoe's power to remember details, but, as I have already said, very little for his willingness to tell the truth about his own writings, or for his consistency in political matters. I have found in the past few months fully half a dozen tracts that oppose Defoe's official attitude toward Harley and his measures, yet are as clearly products of the great pamphleteer's pen as most of those that are assigned to him by Lee and Crossley. Besides, a careful scrutiny of other tracts assigned by Crossley to Defoe does not reassure us as to the latter's consistency, and it is always possible to argue that in tracts like the "Arguments" written in the form of a letter to a representative of a group of voters, Defoe took a point of view acceptable to the class for whom he was writing, rather than one consistent with his utterances as a paid writer in the service of Harley. As a matter of fact, I have been reluctantly forced to conclude that Defoe defended the policy of Harley and the Tories while his heart was really with his old employer Godolphin and the Whigs; and that on the accession of George I., he gave himself the pleasure of denouncing, under various disguises, the policies and the politicians he had been bribed or persuaded to support.

Be this as it may, I have no doubt whatsoever that he did write, "Some Considerations" (No. 175); I think it very likely that he wrote the "Arguments" as he says he did, for the style of that seems to me to be much more in Defoe's vein than Crossley anxious to defend his hero's consistency, was willing to admit; and—"alas! for the rarity of Christian charity"—I am equally disposed to hold that he also wrote the tract in opposition to these two,

"The Triennial Act Impartially Stated." which, in the chastened language of Boyer, "was judged, from its loose style and way of arguing, to be written by that prostituted tool of the last ministry, D—D—F." In other words, I agree with Crossley in assigning one tract, with Defoe in assigning another, with Boyer in assigning a third to the will o' the wisp whose devious courses I am trying to follow. I have formed my opinions upon internal evidence only, for I place practically no reliance on Defoe's own statement, since he hated Boyer so intensely, that he would, I think, have been quite capable of claiming the pamphlet Boyer praised and disclaiming the one Boyer denounced, merely to have the laugh on his adversary. It should be remembered, too, in this connection that the letter in which Defoe deals with these pamphlets was not written primarily about them, but was designed to repel another charge Boyer had brought, viz., that Defoe had made up out of whole cloth the recently published "Minutes of the Negotiations of Mons. Mesnager," which purported to be a translation from the French. We shall see in a moment that there is scarcely a doubt but that Defoe was impudently false in his denial of this main charge of Boyer's, and I believe that, having decided to brazen the matter out, he concluded that he might as well hark back a year and deny Boyer's former charge, on the principle that one may gain credence in proportion to the magnitude of one's effrontery.

As for No. 176, "The Alteration in the Triennial Act Considered," and for two other pamphlets in favor of longer parliaments, to wit, "A Letter to a Friend in Suffolk Occasioned by a Report of Repealing the Triennial Act" and a "Second Letter" to the same friend, both of which were attributed to Defoe by the late Col. Grant, I find myself in doubt whether the internal evidence is strong enough to warrant a positive ascription. Certainly Crossley and Lee could not consistently have accepted the two letters, for the writer of them denounced Harley and his ministry; but the style of all three pamphlets leads one strongly to suspect Defoe's authorship. Six pamphlets on one subject within a few days—and may he not also have written "The Innkeepers Opinion of the Triennial Act"?—seem too many to saddle even on Defoe; but we must remember that they were well distributed among rival publishers and that the subject was one upon which Defoe's new political employers would have been glad to have his assistance. The arguments employed do not vary greatly in any of the tracts I have read on the subject, and at Defoe's rate of composition he could have written the whole batch in four or five days. But perhaps it is a good plan "to split even"; to assign him three pamphlets very positively, and three provisionally.

No. 181 is the already mentioned "Minutes of the Negotiations of Mons. Mesnager, at the Court of England, Towards the Close of the last Reign," the authorship of which Defoe vigorously denied. I can add little to Lee's exhaustive discussion of the questions involved (cf. his letters in *Notes and Queries*, 4th ser., v., 177, 202), save to say that internal evidence makes it certain that the author of the "Minutes" was an Englishman and most probably Defoe, and that modern students of the diplomacy of the period (cf. A. Legrelle's "La Diplomatie française et la succession d'Espagne") make no use of the book. Defoe's references to it in his "Memoirs . . . of the Duke of Shrewsbury" (Lee's list, No. 185) render me still more confident that he was responsible for the fabrication.

These are all the items in Lee's list that seem to me to lie open to any suspicion worth recording here, except one of the picaresque tracts, No. 248, "Street Robberies considered" (1728), which in the opinion of Dr. Frank W. Chandler, our chief authority on this class of writings, "unlike Defoe's authentic picaresque work, is marked by ironical humor in the right Spanish vein," and No. 252, the prose pages prefixed to Robert Dodsley's poem "Servitude" (1729). With regard to the former of these I am inclined to think that, on the whole, the style and certain features the tract has in common with other contemporary tracts certainly by Defoe warrant us in continuing to ascribe it to him, at least for the present. As for the latter I confess I am not convinced that Lee did not give a free rein to his imagination when he described how the old and ill Defoe wrote several pages satirizing one of his own tracts in order to fill out and help to sell a book by a struggling young author. The arguments Lee gives in support of his ascription appear to me not very sound, and the question seems mainly to turn on the correct dating of an undated edition of the tract. If Hazlitt and the British Museum authorities are correct in their surmise "circa 1725," Lee, who is followed in the article on Dodsley in the "Dictionary of National Biography," is probably wrong in his ascription; but I am not yet in a position to clear the matter up. It is time, however, to pass from Lee's possible errors of commission to what seem to be his errors of omission, which shall form the subject of my next communication.

W. P. Trent.

Correspondence.

THE UNIVERSITY OF MAINE.

To the Editor of The Nation:

Sir: The letter of Professor Harrington on the University of Maine contained so many specious pleas that I ask leave to challenge and answer some of them. When he says that the dangers to small colleges in private hands from State institutions giving free instruction, have proved imaginary, he is wide of the mark. This socialism in education has injured greatly the small colleges both in Maine and other States, while it has done, and is doing, great injustice to the wage-earning classes everywhere. Their children in almost all instances have to go to work when they are seventeen, but the beneficiaries of the State University are a small portion of the children of the middle class of citizens, whose income per year is between $1,200 and $3,000. That is, Peter is robbed to pay Paul. President Hyde and his associates did just what was right, not only for their own institutions, but for the working men of Maine, when they opposed the large appropriation for an institution, which gets most of its money out of the public treasury. Maine is comparatively a poor State. Its industries are lumbering, farming, ice gathering, textile manufacturing in the west, fisheries, and commerce. The population of its largest city is only 50,000, while the whole State population numbers 700,000. According to the statistics of 1903-1904, there were in the university altogether 415, distributed thus among the following courses: 109 electrical engineering, 135 civil engineering, fifty-one mechanical engineering, ten agriculture, fifty-one general science, thirty-five non-classical course, twenty-four classical course. Fifteen were studying Latin and eight Greek. The institution in any one year benefits one-fifteenth of one per cent. of the population. The college part of the institution barely numbers one hundred. Yet it asked this year for $150,000 a year from the public treasury, and finally got $65,000 for two years and $90,000 for buildings.

Professor Harrington affects to deride this argument by showing that if the amount spent on the classical department were appropriated to the teachers of Maine it would not buy them each a new hat. He does not deny the principle, but by taking a very small portion of the appropriation figures out a small quotient. Let us try a fairer method. New York has just spent $5,000,000 on the new buildings of the City College, taken from the taxpayers, and thus increased the cost of education per capita through that institution 50 to 75 per cent., because of interest on investment and increase in the annual budget. Only the wisdom of the late Gov. Higgins prevented the repetition of this unjust form of taxation in Brooklyn. Now, suppose the authorities had said: "This use of so much money on the favored few, who should get their college education by paying for it out of their own pockets, is an outrage on the working classes, for whom our educational system is primarily intended. We will spend this enormous sum entirely on the grammar schools, building new buildings that are so much needed, increasing the number of teachers to pupils, and paying more attention to backward pupils."

Mr. Harrington's argument about the benefit to Maine taxpayers of money brought in by Massachusetts students reminds me of some argumeuts I have heard about the beneficent effects of a high protective tariff. He seems to think that money paid out circulates through all pockets, like blood through the human body. He says "half of the $20,000 brought by Massachusetts students goes to the university and half to the taxpayers." That may go to the taxpayers of Orono, who do not support the university, but are largely supported by it. But very little of it goes to the taxpayers of the State.

It not only involves injustice to Maine, but has set a demoralizing example to other New England States. An organization called the New England Education League apparently is trying to promote this form of Socialism in Massachusetts, and in Connecticut there are indications of a similar movement in a small way in connection with the Storrs Agricultural School. The University of Michigan alone deserves among Western institutions the approval of those who believe in justice to the working classes. It has always set its

face like a flint against free tuition, and, though one of the largest, takes less than a half million, this year, from the State Treasury. Compare that amount with Minnesota, asking for an aggregate appropriation of $1,500,000, Wisconsin $1,200,000, and Illinois $5,300,000, with a desire to establish a graduate department, a most costly and extravagant function, in rivalry with the University of Chicago.

GEORGE L. FOX.

New Haven, May 31.

COLONIAL FRANCE.

TO THE EDITOR OF THE NATION:

SIR: I read in the *Nation* of May 9 that Indo-China "represents, as yet, the only instance of appreciable success in colonial administration that France can show," and that "its loss would undoubtedly mean the end of the republic as a colonial, and, possibly, as a world-power." Will you allow a Frenchman to protest against such misleading statements? Indo-China is at present the richest colony that France has, but great foreign experts, such as Sir Harry Johnston, had already paid a high tribute to the success of French rule in Tunis when Indo-China was still struggling and unpopular. Our largest colony, the West African Federation, under Gov. Roume, has shown the most wonderful vitality. The loss of Indo-China would not mean the end of the republic as a colonial power. Indeed, ardent colonialists, like the well-known geographer, Onésime Reclus, advocate our giving up of Indo-China altogether, the future of France as a colonial power being in Africa. Without Indo-China, France would still be by far the second largest colonial power in the world, with an empire as large as the whole of the United States and possessions. The magnitude of that empire, and its commercial importance—for its total trade at present is about $200,000,000—is a fact that the French themselves have only recently realized. The English taught us that we had large, prosperous, well-governed colonies. The Germans knew it before we did. And the Americans will certainly learn it in their turn.

ALBERT L. GUÉRARD.

Williamstown, May 16.

THE EXCHANGE OF PROFESSORS.

TO THE EDITOR OF THE NATION:

SIR: My attention has been called to an article in the *Nation* of May 30, on the "Exchange of Professors," in which only one of the statements about Professor Richards is correct. He *is* "one of our ablest chemists," but he did not learn "nearly all that he knows from Germany." On the contrary, his training was entirely American in the determination of atomic weights—the work on which his reputation principally rests, and the subject of his lectures in Berlin.

He is lecturing in German; and, even if he were not, his lectures could not degenerate into "a pastime for some members of the American or British colony," as they can be understood only by advanced students in chemistry.

Moreover, strangely enough, Germany has never taken the highest rank in the determination of atomic weights, although pre-eminent in all other branches of chemistry. The great masters in this work have been furnished by Sweden, France, Belgium, and now at last by the United States, so that Professor Richards is giving instruction in Berlin which could not be given so well by any native professor.

In addition to his lectures, he has eight doctors of philosophy studying research with him in the laboratory, thus training them in the most accurate and delicate work which has yet been done in chemistry. This alone more than justifies his visit to Berlin.

CHARLES LORING JACKSON.

Chemical Laboratory of Harvard College, June 1.

MR. TABB'S "QUIPS AND QUIDDITS."

TO THE EDITOR OF THE NATION:

SIR: Of "Quips and Quiddits," my forthcoming book from Small, Maynard & Co., I should like to say publicly that the whole responsibility—for preface, selections, illustrations, and proofs—rests with the publishers. JOHN B. TABB.

Ellicott City, Md., May 29.

Notes.

Houghton, Mifflin & Co. are preparing the "Ponkapog" edition of Aldrich's Complete Works, in nine volumes, in the same style and size as the "Riverby" Burroughs and "Walden" Thoreau.

Longmans, Green & Co. will soon publish an illustrated edition of Cardinal Newman's "Dream of Gerontius." They have also about ready the seventh volume of "The Political History of England—From the Accession of James I. to the Restoration," by Prof. F. C. Montague.

The Cambridge University Press (Putnams) has about ready the second volume of A. R. Waller's edition of Matthew Prior. In this volume are printed for the first time Prior's "Dialogues of the Dead," and numerous unpublished verses.

Elizabeth Luther Cary has prepared for Putnams a volume on Daumier the caricaturist.

We learn from the Macmillan Co., the American publishers of the series, that the twentieth, and concluding, volume of "Purchas His Pilgrimes," was printed, and in the binder's hands, before the death of Robert MacLehose.

The "Essays, Literary and Historical," of John Fiske have been reissued by Macmillans in a single volume. The same house has also issued in a single volume Mrs. J. R. Green's "Town Life in the Fifteenth Century." Neither of these works needs any recommendation to-day.

John Lane Company has brought out a new edition of H. T. Wharton's "Sappho," with illustrations in photogravure. Besides Mr. Wharton's memoir of the poetess and his literal translations of her verse, the book gives a number of metrical translations from various writers.

E. P. Dutton & Co. have about ready a new "Life of Captain James Cook," by Arthur Kitson. It is said that the earlier lives—by Kippis, Hawkesworth, and Douglas—are erroneous, and have taken unpardonable liberties with Cook's own manuscripts. Will this bring a revival of interest in Capt. Cook, who was for so long the traveller, *par excellence*?

Mrs. A. L. Wister has placed in the hands of the J. B. Lippincott Company what will probably be her last work of translation. It is from her favorite author, Adolph Streckfuss, and is called "The Lonely House." She has not done any work of the kind for about fifteen years.

There are to be six new volumes in D. C. Heath & Co.'s Belles-Lettres Series, viz.: "The Fair Penitent and Jane Shore," edited by Prof. Sophie Chantal Hart; Chapman's "All Fools and the Gentleman Usher," by Prof. T. M. Parrott; "The Spanish Gypsy and All's Lost by Lust," by Prof. E. P. Morris; "Exodus and Daniel in West Saxon," by Prof. F. A. Blackburn; "The Owl and the Nightingale," by Prof. J. E. Wells, and "Select Poems of Alfred Tennyson," by Prof. Archibald MacMechan.

Henry Holt & Co. announce a fourth edition of Owen Seaman's burlesque "Borrowed Plumes." Mr. Seaman is the editor of *Punch*.

The publication of Paget Toynbee's work on Dante's influence in English literature has been delayed by the discovery of a mass of new material.

Biblical students will be interested in the announcement that the Pope has issued a decree entrusting the revision of the Vulgate to the monks of the Benedictine order. This is the most important result as yet of the Biblical Commission which was appointed towards the end of the Pontificate of Leo XIII. Since the Clementine edition of 1592 there has been no official revision of the text, which as a matter of fact has never been scientifically ascertained. No pains or time will be spared to restore the exact text of St. Jerome.

We are soon to have a hitherto unknown work by Verlaine, entitled "Le Voyage en France par un Français." It is a voyage in the sense of literary and political criticism, and dates from 1880, when Verlaine was an ardent convert to religion. Another French book about to appear is "Avant Machiavel," the first part of "Le Machiavélisme," by Charles Benoist.

Oscar Wegelin is preparing a second series of "Early American Poetry," being titles of books and pamphlets written by authors born or residing in the United States and Canada, and printed between 1800 and 1820. It will be published in the fall in an edition of one hundred and fifty copies.

The first number of the quarterly *Bulletin of the Bibliographical Society of America* has just appeared. Bibliographical periodicals in America have been generally short-lived. This *Bulletin* has a modest beginning, the first number containing fourteen pages only of reading matter. The president of the society, W. C. Lane, librarian of Harvard University, warns the members that the success of the quarterly will depend upon their coöperation. The purpose is to make it a record of current bibliographical work in America. The greater part of the titles recorded in the *Bulletin* will be of special bibliographies of various kinds, but works on the science

and art of bibliography, works on manuscripts and public archives, accounts of libraries and collections, both public and private, library catalogues and contributions to the history of printing and bookselling, will find a place. The commercial side of printing and bookselling as well as library administration will be excluded. The editors are W. Dawson Johnston, T. Franklin Currier, and Victor H. Paltsits.

The American Type Founders Company, which is a consolidation of all but one of the letter-founders established in America prior to 1869, is bringing together at their central establishment in Jersey City a library and museum relating to letter founding and printing in general in America. The idea was first suggested by Henry L. Bullen in an article "Discursions of a Retired Printer," published in the *Inland Printer* in July, 1906. He there called attention to the desirability of bringing together in one place a library of books on printing and typefounding, and the actual matrices, types, and printing apparatus used by American printers, corresponding to some extent to the Plantin Museum at Antwerp and that of Euschede & Sons at Haarlem. The suggestion interested the officers of the company, and money was appropriated for the acquisition of such material under the direction of Mr. Bullen. As the result of only about six months' effort, the collection is already important, including among the rest a very nearly complete series of American type-specimen books. The first New York type-founder, Adam Gerard Mappa, who came here in 1791, used a type specimen book printed at Delft, Holland, in 1787. The only copy known is in this collection. Christopher Saur established the first type-foundry in America at Germantown in 1772. Jacob Bay, 1774, and John Baine, 1778, followed at Philadelphia. These three, with Mappa's establishment at New York, were merged into one by Binney & Ronaldson in 1796; it has ever since been in operation at Philadelphia.

A new section of the Oxford English Dictionary carries the slow alphabetic procession from Piper to Polygenistic, edited by Dr. James A. H. Murray. As in all the sections the great distinguishing feature here is the number of illustrative quotations, showing the historical changes in the meaning of a word; which is the one supreme function of a dictionary. The number of such quotations in the present section is 20,848, against 2,207 in the corresponding section of the Century, and 438 in the Standard.

We have newly received the spring number of the *Revue internationale des études basques*, which appeared for the first time last January under the editorship of Don Julio de Urquijo. Of its contents written partly in French, partly in Spanish, partly in Basque, a large proportion relate to things philological. Of this nature are F. Baraibhar's article on the Alavesan words not figuring in the Dictionary of the Real Academia; De Charencey's "Etymologie Basque," H. Schuchardt's explanation of the forms "Dautza" and "dauntza," and the notes by Luis de Eleizalde on Vinson's "Études Basques," and the "Otoitz Gayak" of P. Mendiburu. History and biography are represented by G. Lacombe's monograph on Prince Lucien Bonaparte, by V. Dubarat's article on the "Assézat" and the "Chéverry at Toulouse," and De Vaurgain's account of the friend of Henry of Navarre, Corisande d'Andoins, Dame de Gramont. Among others items the forthcoming numbers will include a translation into French of H. Schuchardt's paper, entitled "Baskisch und Romanisch," articles on old Basque names, and the Iberian tongue, or tongues, by D. Arturo Campion and Julien Vinson, a biographical study of Yuan de Iciar Vizcaíno, and reproductions in photogravure of an old Biscayan catechism and of the "Borracho Burlado," a comic opera in Basque and Castilian by a noble of Guipuzcoa.

The last volume of the Proceedings of the Scottish Antiquaries (Edinburgh, Neil & Co.) contains twenty-four papers in all. As usual they fall under two heads: eighteen relate to finds, excavations, buildings, etc., mainly of the pre-historic and pre-mediæval periods; six to literary, historical, and similar subjects. Of the former class of contributions the most elaborate is the account of the Roman Forts on Bar Hill (Dumbartonshire), amounting to over a hundred pages, by George Macdonald and Alexander Park, and the report on the stone circles of Banffshire, by Fred R. Coles. Important, too, are Lieut.-Col. McHardy's "Vitrified Forts," John M. Loney's notice of the Long Graves, near the source of the North Esk; R. Munro's notes on a find of stone knives, presented by the Right Hon. R. C. Haldane, and the account of the cemetery of Nunraw, by the Hon. Y. Abercromby, and A. Mactier Pirrie. The less ancient remains date for the most part from Post-Reformation tomes; such are the monuments in the churchyards of Currie, Kirknewton, and the Calders, described by Alan Reid, and the Castle on the Isle of Loch Dochart, Perthshire, described by Mrs. Place. Of the second class of papers the most interesting are Alexander O. Curles's "Inventories of the House of Rossie, Montrose" (from 1693-1740), and Caird Inglis's account of John Paul Jones.

Industrial education in Austria is the subject of a suggestive report to the Department of Commerce by Special Agent A. B. Butman. The present method has been developed within the last ten years, its main underlying purpose being the endeavor to form a close connection and interdependence between school and practice. The best results are said to have been attained by those schools requiring as one of the terms of admission some years' previous practice in workshops, such pupils forming the most promising material and proving the more eager students. A typical institution is the Technological Trade Museum of Vienna, in which at a very small fee instruction is given in the chemical and metal trades together with a general education, *i.e.*, in language, mathematics, physics, etc. Absolutely free tuition, however, is given in woodworking, plumbing, carpentering and joining, shoemaking, dressmaking, and tailoring, etc., small model shops, with their attendant foremen and managers, being provided for practical instruction. The shoemaker's course may be completed in six weeks, and includes anatomy of the feet, measure taking, cutting, computing, etc. The joiner's course occupies eight weeks, during which time a knowledge of the scientific treatment of woods is taught. Legal instruction pertaining to the respective courses is given in every case. To aid needy students the Government provides stipends and scholarships. Since the opening of this institution, 3,026 artisans have received instruction in their trades. The Government also maintains teachers who travel regularly in the provinces, giving similar instruction to natives in remote country towns.

"Church Philanthropy in New York" is the title of a valuable book of facts concerning the large and varied social effort of the Episcopal Church in this city (Thomas Whitaker). The author, the Rev. Floyd Appleton, Ph.D., has sketched briefly the history of the many Episcopal philanthropic institutions, and on the basis of extensive compilation of statistics he offers suggestions as to promising lines of future activity. The pamphlet is a convenient manual of information concerning a large class of remedial institutions, which have been supported with self-sacrifice and administered with efficiency.

The "Fünfjahr-Katalog," issued every half-decade by the house of Hinrichs in Leipzig, contains in the issue covering the period of 1901 to 1905, on 2,371 pages, a complete list of the books, journals, pamphlets, maps, etc., which have been issued by the German book publishers during this period. In addition to the usual exhaustive index of subjects and authors, the present issue contains a number of new features, such as bibliographical notices, changes in the titles of periodicals, and the like. This collective catalogue is a standard work for bibliophiles and indispensable for libraries.

The oldest son and heir of Lord Rothschild, Walter Rothschild, has prepared a work on the different kinds of birds which have become extinct during the past seven hundred years. The book is to be published in the near future in an absolutely permanent shape. It is printed on a kind of paper which years of experiments have proved to be indestructible, a quality which the author insisted upon because the work is to remain a lasting record of these extinct birds. The cost of publication is computed at about one hundred thousand dollars, and only three hundred copies will be issued, selling at $125 each.

The second volume of David Jayne Hill's "History of Diplomacy in the International Development of Europe" (Longmans, Green & Co.) betrays no marked departure from his method in the first. As we said of that, so must we say of this, that he seems to have sought an excuse for re-writing history. It recalls the old Darwin story about giving a tired boy a cane astride of which to gallop home refreshed. If you are weary of dull annals, says Mr. Hill, let us call them "diplomacy," and then see how enlivening they at once become. He appears to be innocently aware of his logical difficulty. "Definitions," he writes, in his preface, "have their proper place at the end, rather than at the beginning of historical studies. If we define diplomacy as it now exists, we shall, of course, *fail to find it in the earlier periods.*" Hence the plan of calling every-

thing diplomacy that comes to the net. The present volume traces "The Establishment of Territorial Sovereignty" from the fourteenth to the seventeenth century. The author has shown great industry in going to the sources; hut his skeletonized account of so large and long a movement is necessarily dry reading. By any other name than diplomacy, it would have smelled as much of the lamp.

S. G. Tallentyre's "Friends of Voltaire" (Putnams) consists of a disconnected series of sketches, not hound together even hy any consistent plan of reference to Voltaire. They are ecstatic expositions of some supposedly eminent trait in each case, rather than true hiographies. The suhjects are D'Alemhert thè Thinker, Diderot the Talker, Vauvenargues the Aphorist, Helvetius the Contradiction, Turgot the Statesman, Condorcet the Aristocrat, etc. By this method the modesty of nature is violated and nothing is left except high lights. We have such edifying results, for example, as this: "The eighteenth century, even if it saw any difference between vice and virtue, which is douhtful . . . "; and this "To her [Mlle. de Lespinasse], as to a sister of consolation, came Condorcet, marquis, mathematician, philosopher." In the effort to he vivid the author hecomes vapid. For some reason not readily discernihle, he likes to turn his sentences hind end foremost, in what is known as the inverted order. He uses all the little tricks hy which "popular" hooks of this kind are made. In less than three pages Voltaire is patted on the hack as "brother Voltaire," "old Voltaire," "friend Voltaire." Apart from these petty viees and the eonstant effort to awaken the momentary interest of uninformed readers, the hook has a certain journalistic merit. It ean be read rapidly, and many of its judgments strike one as sound, while still more of them are no douht sincere.

In Dr. Gaston Bodart's "Mllitär-historisches Kriegs-Lexikon" (Wien and Leipzig: C. W. Stern), we have really a novelty, whether from a military or an historical point of view. The time of the hook is 1618-1905, and we have before us the first of the six parts (1618-1702). The arrangement is purely chronological, each hattle, land or sea, siege, engagement, affair, heing presented, where possible, under the form of a commercial account as it were. Place, date, commanding generals, numbers and kinds of troops engaged, losses, and trophies, all these are clearly set forth by a judicious seleetion of type and spacing. Were this all, the hook would still command attention as a work of refercnce, hut the author has greatly increased its value hy adding tahles and excursus growing out of the suhject; for example, to mention only two, tables of losses by fire, estimation of the relative shares of European states in single wars. An alphabetical index is to close the work, the indication of sources and authorities heing reserved for the last numher, though serially it is a part of the first.

After a painful illness of several years, Ludwig Trauhe, professor at the University of Munich, died on May 19, at the age of forty-six. Already one of the foremost authorities on mediæval Latin literature and palæography, he had only begun to realize far-reaching plans in both these domains. His largest work was the edition of Vol. III. of the Carolingian poets in the Monumenta Germaniæ Historica. He wrote also numerous articles and monographs, each original if not epoch-making in character. His last undertaking was the publication of a new series—Quellen und Untersuchungen zur lateinischen Philologie des Mittelalters—which was to embody in studies hy himself, his friends, and his pupils, principles and methods that he had made all his own. Vol. I. had appeared, and he was at work on an important article for the second volume at the time of his death. Of an infallihle memory and amazing powers of acquisition, Trauhe united with these traits of the encyclopædist the delicacy and penetration of a literary critie. His lectures, while teeming with well-ordered information, avoided professorial system, and were delivered with eloquence. Not a few among the younger American scholars can hear witness also to his generous hospitality, his ready sympathy, and kindly help.

Judge William Kneeland Townsend of the Second District, United States Circuit Court, died in New Haven on Saturday morning. He was born in New Haven in 1849, and graduated at Yale in 1871, receiving the degree of LL.B. in 1874, and that of D.C.L. in 1880. His legal career was begun in New Haven, where he became corporation eounsel for the city. In 1892 he was appointed judge of the United States District Court for the District of Connecticut, and in 1902 he was promoted to be judge of the United States Circuit Court of the Second Circuit. In addition to his active serviee on the bench, which he did not relinquish, in spite of ill-health, Judge Townsend was professor of the law of contracts at Yale University, and was regarded as one of Yale's most brilliant sons. He was a contributor to the magazines, and the author of several legal works, among them, "New Connectieut Civil Offieers," "History of the American Law of Patents," and "Trademarks, Copyrights, and Admiralty."

WOMEN OF ANTIQUITY.

Woman: Her Position and Influence in Ancient Greece and Rome, and Among the Early Christians. By James Donaldson. New York: Longmans, Green & Co. $1.60 net.

The story of the evolution of woman in civilized society is so thickly set with contradictions and inconsistencies that a writer who is determined to tell it without partiality is practically cut off from the luxury of generalizations. There are few so determined as that, especially where impartiality is so likely to make dull reading. Accordingly, in almost every volume whose title begins with the word "Woman," we must reekon with a *parti pris*. One writer proceeds to prove from the pages of history that only under absolute monarchies have women enjoyed or can expect to enjoy even a semblanee of their rights, so that "Down with democracy" should he the war-ery of American suffragists. Another demonstrates from the same evidence that socialism alone can free women from slavery. Benecke easily explains away every passage in Greek literature that conflicts with his thesis that romantic love was unknown to literature until a poet whose works have perished, an older contemporary of Plato, Antimachus of Colophon, sat down to write an elegy in honor of his dead wife. If Benecke he right, many a page of excellent sentiment has been wasted on the parting of Hector and Andromache, and the relations of Odysseus and Penelope. Even a scholar who has no particular thesis to support—Tucker in his recently puhlished "Life in Ancient Athens"—falls into generalizations rather than leave the question open. "To an Athenian," he says, "marriage was apt to he irksome," and he offers as proof the joke in Antiphanes: "What! Is he actually married? Why I left him alive and taking exercise." This is a jest out of which the humor will never die, and for that reason it tells us nothing about the wives of the fourth century B. C. The vicissitudes of women in Greece and Rome must be gathered from the writings of men, from Homer down, and, when stated in general terms, should always he accompanied by a list of exceptions to illustrate the variety of human character and the difficulty of measuring the influence of women hy a recital of their legal rights or disqualifications. Of such evidence Dr. Donaldson is none too lavish.

Every one will assent to his account of the Homeric woman of rank and of the honors and dignities which she shared with her hushand, as she still shares them in aristocratie societies to-day. When he fell, his lot was death, and hers slavery; the etiquette that made her follow her conqueror must have been due to her own preference for survival at any cost, and we need not shed more tears for Andromache than for Hector. So much for the woman of rank as we see her on the surface, that is, as men envisaged her when they gave us the charming picture of Nausicaa's domestie tastes, and ignored any posihle justification for Clytemnestra's vengeance on the cruel and unfaithful Agamemnon. Dr. Donaldson, like so many others, omits all that one may read hetween the lines: the humiliation of women of rank hy the ever-present and always more beautiful eoncuhine, and all the other drawhacks to home life that may he assumed in that half-civilized military society. What was the treatment of women of the lower class we ean only eonjecture.

Under the Athenian repuhlic any free male citizen was more important than any woman. Dr. Donaldson's explanation is that the men of Ionian descent who made Athens the glory that was Greece, kept up their race traditions and regarded their wives with an almost Oriental eye, whereas the Lesbians and Dorians allowed them far greater freedom. An Athenian woman must not be seen or heard except at religious festivals, of which frequent opportunities they ohviously made good use. Nevertheless, the wife's dowry stayed with her, even when she was repudiated hy her hushand; and we may say in passing that the relation of a woman to her dowry throws only a misguiding light on her social position and influence in Greece and Rome. Considered strictly according to her legal status, the married woman at Athens was a being

so incapable that, should she give her husband a piece of advice, and should he take it, his action on it was set aside by the law. Her husband could repudiate a woman if she drank a single glass of wine. Are we therefore to generalize about the temperance and humility of the average Athenian wife? We might as well suppose that the picture in Xenophon of the young wife who, "once tamed," was devoted to her duties, is a realistic portrait. Against it we may set the only Athenian wife of classical times of whom we know anything definite, Xanthippe, the scold, or the matrons of the "Ecclesiazousæ" of Aristophanes, who storm the Assembly like modern suffragists only with a good deal more strategy and success. Never can you measure the actual influence of woman by her legal status. Let us hope that the historian two thousand years hence will be judicious enough to prefer the evidence of contemporary fiction, and to apply to this age Dr. Johnson's saying that nature has given so much power to woman that the law cannot afford to give her more. It is unfortunate that we know so little about the woman's rights movement in fifth and fourth century Athens, and can only see its reflection in two scurrilous comedies of Aristophanes, in the "Republic" of Plato, and in the tradition that Aspasia tried to rouse Athenian wives to a sense of their oppressed condition. Aspasia, like Xanthippe, always serves to round a period. She belonged to a class that enjoyed peculiar consideration. For one Athenian wife—and she, like Xerxes, owes her vogue partly to the fact that her name begins with X and was almost indispensable to educational alphabets—we know the names and histories of half a dozen charming and witty courtesans. They at any rate were educated to discuss literature and politics with men, and so saved Athens from the reproach of those moderns for whom the salon represents the fine flower of human intercourse. Still, we need a good deal of explanation and reassurance by Platonists when we find Socrates advising one of these ladies how best to succeed in her profession.

The Greeks who settled in Egypt after the death of Alexander found there an aristocratic society in which women enjoyed a scandalous freedom, making contracts in their own names, owning property, and allowed equal legal status with their husbands. The country of the Cleopatras was, not, indeed, likely to impose restrictions on women. In Rome we find the same story. Women had less acknowleged freedom under the Republic, more under the Empire. For five hundred years after the founding of Rome there was no case of divorce. But the example of Cato, that model of austere morals, who divorced his wife that she might marry a friend, and remarried her when she was enriched by the friend's death, or of Cicero, who put away his wife because he wanted a new dowry, shows that if we want to illustrate the amazing ease and frequency of Roman divorce we need not wait for the Empire. Divorce implied no disgrace, and it would be hard to parallel in America the case of the Roman matron who found herself the twenty-first wife of her twenty-third husband.

The influence of the Christian Church did more than any legal code has ever achieved to deprive women of property and liberty. It was reserved for a bishop in the sixth Christian century to decide that woman has no soul, and is therefore not a human being. It is unnecessary to dwell on the influence of St. Paul in planning the rôle of the Early Christian woman. Her part was to be the chief cause of sin, and to avoid and humiliate her was the sure mark of the saint.

The Principal of St. Andrews wrote these essays for the *Contemporary Review* many years ago, but his statements were based on sound scholarship, and were made with unusual caution, so that he could publish them in book form with the addition here and there of footnotes embodying certain modern discussions. Besides this he has added some sixty pages of loose notes on the debates that still rage about the persons of Sappho and Aspasia or the precise relation of the "Ecclesiazousæ" of Aristophanes to the "Republic" of Plato. He has not attempted to make an organic whole of the work, but it contains material that will be useful to the writer who may some day give us what so far does not exist in English—a detailed history of woman down to the sixth century A. D. Dr. Donaldson's bibliography is fairly complete, and the book has a good index.

CURRENT FICTION.

Alice-For-Short. By William De Morgan. New York: Henry Holt & Co.

The reviewer, who, some six months ago, was expressing his delight in "Joseph Vance," had not the courage to predict that it would give equal delight to a large number of people. He hugged to his bosom, perhaps, a sense of special privilege, and listened with surprise to the general chorus of lay praises, which was shortly to be heard, and which continued to be swelled by voices from the most improbable quarters. It was evidently foolish of him to imagine himself alone in the revolt against the modern mode of fiction, marked by a hard polish, a studied impersonality, a brilliant inconclusiveness. "Joseph Vance," with its full-blooded people, its unabashed sentiment, its life-like inconsecutiveness, its endless delightful talky-talky, won back for us fathers and grandfathers of to-day the dear atmosphere of that world of fiction in which we were reared, and which seemed almost to have become a dead and cold world. If one were to trace the origins of Mr. De Morgan's method in an ungenerous spirit, it might be made to appear a small thing. This is Dickens, that is Thackeray, yonder is a hint of the Du Maurier stepping-stone. Very well: there is no manner of doubt as to the school to which this new-old craftsman belongs; the important fact is that he belongs to it, and does not merely hang upon its heels. Of "Alice-for-short" it may be said, at least, that it is sure to retain for its author the friends which "Joseph Vance" made for him. It is not so good as its predecessor; along the same vein though it be, its ore is of inferior grade. There is no denying that Mr. De Morgan's humor now and then degenerates into mere facetiousness, or that his familiar prolixity becomes at times pure garrulousness. More than one expectant reader, to our knowledge, was rebuffed by the Dickensish extravagance of the opening chapters of "Joseph Vance"; in "Alice-for-short" the test of endurance is greatly extended. Yet one cannot help liking M. De Morgan, even when he is most trying.

The plot of this second book is much more elaborate than that of the first; opinions will probably differ as to whether or not it is a little in the way. Involving, as it does, the lapse of something like a century and a half, and devolving with the utmost imaginable leisureliness, it may well be a discommodity to the restive reader. Spooks are involved in its unravelling, hidden treasures, a jug, a ring, a manuscript—several manuscripts—and an old lady resuscitated in the nick of time after fifty years of inanition. Nothing, of course, is told straightforwardly; and when the promising moment arrives for this or that culminating scene, it is dismissed with a negligent word or two. Very likely fifty pages follow which do not advance the story by an inch; it is all very irritating and pleasant. The writer has, we should say, a sensitive conscience in the matter of plot—a desire to give the reader his money's worth of that staple—but an instinctive contempt for it for its own sake. What really interests him is his persons, and his talk about them. The setting of the story and the general situation are much like that of its forerunner—one is tempted to say progenitor. Little Alicia Kavanagh, Alice-for-short, is a sort of feminine Joseph Vance; a forlorn waif, adopted into a wealthy middle-class family, after the malodorous death of her dingy and drink-sodden parents. Her initial rescuer is a son of said family, a spectacled pseudo-artist and Bohemian, whose studio chances to be in the house supposed to be cared for by the malodorous and fated pair. Of course he marries Alice in the end; that can be foreseen from the outset by any one with half an eye; but the game is to put off that happy and obvious consummation till further notice; to strew obstacles, real or imaginary, in the path of true love, and to keep us amused in the meantime with excursions into the past and alarms in the present.

It is largely for the sake of this (eventually) happy pair that we sit so contentedly through the somewhat long performance. The other Dramatis Personæ are, with three or four exceptions, hardly more than supernumeraries, comic or other. Above all, one misses the sturdy ballast of such a figure as that of Christopher Vance. With our elaborate plot, if the leading lady and gentleman are not sufficient for us, we must content ourselves. And this plot, when one has with some pains made it out from the long series of casual conversations which are Mr. De Morgan's substitute for narrative, one may fairly keep to himself. Enough for any true Briton or cousin of Britons that it satisfactorily proves the gentle birth of Alice, the drunken tailor's daughter.

Of the story teller in the happiest aspect of his exuberant mood we cannot resist giving a single exhibit, in the form of a description of a century-old mezzotint:

It was a lady—such a lady!—As far as her head and arms went, she was inoffensive, if elegant, and seemed more than contented with herself. But when she got to her waist, which she did very quick, as it was tucked under her chin, she began to boom, and only subsided during her stock-

ings. However, elegance resumed its sway at her feet; although they would certainly have been larger had we been consulted.

The Pickwick Ladle and Other Collectors' Stories. By Winfield Scott Moody. New York: Charles Scribner's Sons.

Mr. Moody's little sketches of two hardened bric-à-brac hunters are entirely readable and pleasant, not only for collectors, but for unenlightened persons to whom all hall-marks look much alike, and who view *orange-peel* surface, *famille rose, famille verte,* and *Sung* cloisonné as so many cryptic and meaningless terms. Each story breathes an agreeable leisure, and the thread of the Wyckoffs' adventures among the antique dealers is enriched by a shrewd characterization of the dealers themselves, from Dirck Amstell, the honest Dutchman, to a proud representative of Du Val upon Fifth Avenue. In one of the best of the stories there is a three-sided match of wit engaged in by a dealer, a newspaper man, and a railway magnate; and there can be no better example of Mr. Moody's idealism than the fact that his dealer does not come off winner. The pleasant surprise of the stories as a whole is that, treating of the infinitely small, they constantly broaden into a larger perspective. The history of a *famille rose* platter gains distinct interest when it touches upon the Peace of Portsmouth and the Chinese in New York. And, although the basis of the volume is bric-à-brac, neither old china nor old silver is for a moment allowed to obscure the picture of two ardent monomaniacs happily ravaging their New York for hidden treasure.

Prophet's Landing. By Edwin Asa Dix. New York: Charles Scribner's Sons.

An ingenuous rural tale, with a moral. The landing is a little village on a New England river, which has derived its name from a line of resident hereditary seers, who have for generations found honor in their own country. Whenever any crisis of the first moment has come to the nation or the community, one of them has been inspired to lift his voice for the right. The crisis in this instance is the dominance of unprincipled commercialism. The protagonist is the keeper of a village store. His father, a conscientious and amiable man, has been content with a limited field and a moderate profit, and while he lives the son, presently a partner, seems also content. After his death, however, the son is gradually moved to expand the business, at first by legitimate means and without injuring others. Eventually, as he finds himself succeeding, he becomes less scrupulous and more grasping, till by ruthless underselling, and the acquisition of special railroad privileges, he develops a department store which closes all the other shops in the village. He founds a larger establishment in a larger town, still prospers, and in time gets himself nominated for governor. Meanwhile, as one of the managers of a new local railroad, he has so manipulated the stocks as to ruin half the country-side. After his nomination the prophet calls the people together, and denounces the shopkeeper not only as an individual, but as representative of the greatest danger which the country now has to face. The culprit, who is present, acknowledges his fault, gives up his pursuit of the governorship, and determines to make restitution, as far as may be possible, for all his acts of double-dealing and oppression. A good, obvious tract, which might be more serviceable than literature of a higher order, if it could conceivably be held before the eyes of the wicked shopkeeper and the wickeder railroad man.

The Spider, and Other Tales. By Carl Ewald. Translated from the Danish by Alexander Teixeira de Mattos. New York: Charles Scribner's Sons.

Third in a series of translations from Carl Ewald put forth by Scribners, this little book of fables deserves to be added to the permanent library of childhood. Fables they are, though in the form of studies of animal life; but they are not, like the present American type of "nature"-story, concerned with human beings masquerading as animals. Ewald's creatures are not even individualized to the point of the "Ugly Duckling." Yet though the common experience of the given type is his theme, his way of recording that experience is in one respect like Andersen's. We are all mortal, he seems to say, and there is meaning for us humans in these simple annals of spider, bee, and dragon-fly.

"Hurrah," cry the ichneumons, as they come into the world. "Now it's only a question of finding a caterpillar for our young. Each for himself, and the devil take the hindmost: such is nature's law. We are nature's police: we see to it that things keep their balance. It would be a hideous world, indeed, if it were full of caterpillars." . . . "Or of ichneumon-flies," piped the swallow, and gulped down a mouthful of them as he spoke.

Most of the lessons, if we are to take them as lessons, are stern ones; but there is no trace in the volume of the brooding melancholy which renders Andersen a not altogether desirable companion for a sensitive child.

Journals of the House of Burgesses of Virginia, 1770-1772, and 1766-1769. Edited by John Pendleton Kennedy. 2 vols., Richmond.

The State Library Board of Virgina has undertaken a valuable work in the republication of the Journals of the House of Burgesses of Virginia from 1776 back to the first House of Burgesses of 1619, the first legislative Assembly that ever met on this continent. The first volume, containing the records from 1773 to 1776, was issued in 1905, and has already been noticed in the *Nation* of August 17, 1905. In 1906 two volumes were issued, containing the records from 1770 to 1772, and from 1766 to 1769, the latter of which has just reached the subscribers.

Each volume is furnished with a suitable Introduction by the State librarian, John P. Kennedy. That prefixed to the volume 1770-1772 notices the treaties made with the Indians for the settlement of boundary lines, and the objections made by the military men, especially by Col. George Washington, to the grant of 1,350,000 acres to the Ohio Company in the section recently ceded by the Indians to Virginia. One reason for the objection was that many grants of land to soldiers for services in the Indian wars had been made in that section. This matter was settled, however, by the Ohio Company, for "George Mercer, the agent for this company in London, writing to Washington, December 18, 1770, advised him that the 200,000 acres claimed by officers of the Virginia troops had been accepted by the company as valid, and that their rights should be respected." A matter of more general interest noticed in the Introduction is the association entered into on June 22, 1770, "by the Gentlemen of the House of Burgesses, and the Body of Merchants assembled in this City," *i. e.*, Williamsburg, forbidding the importation of many specified articles "until the act of Parliament which imposes a duty on tea, paper, glass, and painters' colours, be totally repealed, etc." The document is given in full, with the names of 164 signers; but the agreement "was not as effective as desired," as may be seen from the letter of Gov. Nelson to Lord Hillsborough of December 19, 1770.

The Introduction to each volume begins with a brief bibliography stating where original printed copies of the Journals may be found. In the bibliography of the volume just published, 1766-1769, it is stated that the Journal for 1766 was in the British Record Office; those for 1767 and 1768 were among the Board of Trade Papers of North Carolina, the former having "apparently escaped the attention of all bibliographers to date"; the only printed copy of the Journal for 1769, first session, has turned up in the Library of Congress; and for the second session of 1769 copies of the Journal exist in the Library of Congress, the Philadelphia Library Company, and the Virginia State Library. It is still true that we often search far for what lies near at hand. The Library of the Maryland Historical Society contains in one volume, printed in colonial type and bound in ancient style, Journals of the House of Burgesses of Virginia for 1763, May 19 to 31 (pp. 1 to 31); for 1764, October 30 to December 21 (pp. 3 to 98); for 1765, May 1 to June 1 (99 to 154); for 1766, November 6 to December 16 (3 to 77); and for 1767, March 12 to April 11 (78 to 136)—five complete sessions in all. The last two sessions of this volume correspond to the first two sessions of the volume of Journals just issued by the Virginia State Library Board. The Maryland Historical Society may, therefore, contribute something to the bibliography appearing in these volumes. The Society acquired this volume by purchase on August 7, 1880, but its previous history is unknown to the reviewer.

The year 1766 was marked by the death on May 11 of John Robinson, Speaker of the Burgesses and Treasurer of the Colony, and by the subsequent discovery of a discrepancy in his accounts amounting to over £100,000. This matter is treated at length in the Introduction, and it greatly affected the Colony. The committee appointed to examine into the state of the public treasury presented a report on April 9, 1767. The Assembly directed that the treasurer's estate be sold to meet the indebtedness. His action was regarded as a breach of trust, "but many condoned the offence upon the ground that the colony was on the verge of financial ruin."

Further treaties with the Indians in respect to lands and boundaries are no-

ticed at length in this Introduction, such as those signed at Hard Labour on October 17, 1768, and at Fort Stanwix November 5, 1768.

The first session of 1769, beginning May 8, was distinguished by the passage of the noted resolutions of May 16, which caused its dissolution on the following day by Gov. Botetourt (miswritten Fauquier in the Introduction). The tenor of these four resolutions may be seen from the first one, which was as follows:

Resolved, Nemine Contradicente. That the sole right of imposing taxes on the inhabitants of his Majesty's Colony and Dominion of Virginia, is now, and ever hath been, legally and constitutionally vested in the House of Burgesses, lawfully convened according to the antient and established Practice, with the Consent of the Council, and of his Majesty, the King of Great Britain, or his Governor for the time being."

The Assembly was dissolved on May 17 in the usual curt form:

Mr. Speaker, and Gentlemen of the House of Burgesses, I have heard of your Resolves, and augur ill of their Effect. You have made it my duty to dissolve you; and you are dissolved accordingly.

This action of the Governor did not, however, prevent the Assembly from immediately meeting under the presidency of the late Speaker as Moderator and appointing a committee to draw up regulations for the formation of a non-importation association. The full report of the committee, signed by eighty-nine of "the principal Gentlemen of the Colony then present," is given in the Introduction. After the business in hand was finished, with due courtesy toasts were drunk to the King, the Queen, and Royal Family, Lord Botetourt, a speedy and lasting union between Great Britain and her colonies, the constitutional British Liberty in America, and all true Patriots, the Supporters thereof, the Duke of Richmond, the Earl of Shelburne, and Col. Barré—all being friends of America—the late Speaker, the Treasurer of the Colony, and the *Farmer and Monitor*—thus evincing the true spirit of the colony.

The editor remarks in the concluding paragraphs of his Introduction that "the strenuous life of the Assembly from the repeal of the Stamp Act to 1770 was not without its ill effects upon the Colony," and he states that "the personnel of the Burgesses remained practically the same during that period, except in the ranks of those who opposed the Stamp Act resolutions." This volume is printed in the same handsome style as the preceding, but it needs more careful proof-reading.

Sixty-five Years in the Life of a Teacher, 1841-1906. By Edward Hicks Magill, ex-President of Swarthmore College. Boston: Houghton, Mifflin & Co. $1.50 net.

Whittier, in 1873, wrote to a friend in Philadelphia: "Does thee know, I think the old Quaker settlements of Chester, Bucks, Delaware, and Lancaster Counties forty years ago were nearer the perfection of human society than anything I have since seen? . . . It is greater than St. Paul's Roman citizenship to have been born in such a community." It was from such a community that ex-President Magill came. He was born in Bucks County, in the fertile Delaware valley, in a typical Quaker family; a household sober, steadfast, and demure. His parents held the Quaker rule, and stood firmly for anti-slavery and like reforms; they were among the earlier advocates of temperance, excluding even cider from the table. The boy was taught at first in the home, then passed on to the district school, and to the ancient Friends' boarding-school at Westtown, in Chester County. His portrayal of the happy, almost arcadian, life at this renowned old academy is all too brief.

First experience in what was to be his profession came to the author at the age of sixteen, when he found himself in charge of a class in the loft of his father's wagon-house, instructing boys and girls, at three cents per day each, in the old-time studies of the period. Here amid the rustling of quill pens, and "ciphering" on slates, and other primitive activities, the young teacher laid the foundations of those methods whereby he has helped to revolutionize the art of teaching. He decided that the way to a boy's heart is not through the application of the birch or the ferrule; the generations of students of Swarthmore who have known Dr. Magill's ever-kindly governance will here recognize the man's characteristic quality. Nor does his friendly and older-brotherly manner find surer witness than in his statement, that "from the opening of the school I engaged with my pupils in games of ball, snowballing, etc., during the recess, just as one of them, but was careful to put on the serious and resolute schoolmaster's face when I rang the bell for them to reassemble." It all recalls Whittier's vivid picture of the well-loved country teacher in "Snow-Bound."

Returning to his studies after various difficulties in his earlier teaching, Dr. Magill matriculated at Yale, but in a year passed on to Brown University, his progressive spirit attracted by President Wayland's "new college system." He received his degree at Brown in 1852, and for seven happy years was principal of the Providence Classical High School. Then for eight years he served as sub-master in the Boston Latin School. The chapter on this last-named position is one of the liveliest in the book; Dr. Gardner, the able principal, was of the old-fashioned tribe of learned but lashing masters, whose methods our kindly Quaker felt not wholly disposed to follow. But from Dr. Gardner was adopted the formula of those three requisites of a good teacher which as president of Swarthmore we have often heard Dr. Magill urge upon us—first, integrity; secondly, power of control; and thirdly, knowledge of the subject to be taught.

Swarthmoreans will read with keenest interest the latter half of the volume, wherein is seen the upbuilding of the Friends' co-educational college as described by the man who more than any other has brought Swarthmore to its present condition. Very characteristic are his word portraits of his colleagues of the faculty, and his generous pictures alike of his supporters and critics on the board of managers. The modesty of the narrative, its blended humor and gravity, are characteristic of the venerable teacher who at eighty-two still possesses much of the buoyancy and sunshine that carried him through the trials incident to the presidency of a struggling young college. In 1890 he retired from his leadership, taking with him the gratitude of all Swarthmoreans, as expressed in a resolution of the board of managers, for "the ability, the diligence, the devoted enthusiasm to the college service, the faithful and zealous conduct of affairs, which for eighteen years have marked [his] administration."

Taken as a human document, this autobiography has something of the charm and flavor of the old-time Quaker journals, their unconscious wholesomeness and delightful naïveté. It is the portrait of the finer type of Quaker character still happily existent among us. The teacher who carried to his early work the precepts of a wise mother, as told in his opening pages, cultivated through life a blended spirituality and daily practical ability, which made of him, as was said of Sir Henry Wotton, "one who, living in the world, and a master of its ways and courtesies, was yet never of it."

Nelson's Encyclopædia. Edited by Frank Moore Colby and George Sandeman. Vols. XI. and XII. New York: Thomas Nelson & Sons.

This Encyclopædia is now complete, and it is possible fairly to estimate its value as a work of reference. It may be said at the outset that the promise held out in the earlier volumes has been more than fulfilled. The later volumes are freer of errors, and in every way more carefully done than the earlier ones. This, to be sure, can be said as truly of almost every encyclopædia, and its effectiveness as a criticism naturally depends largely on the quality of the first volumes published. Specifically in regard to "Nelson's" the Americanization of the original English text on which the work is based appears to have been done with much more thoroughness and discrimination as the work progressed. And from any point of view the original English work was a good foundation to build on.

There is no question but that this Encyclopædia will take high rank as a reference work, not only because of its conciseness, and the unusual scope and number of the topics treated, but because of the really excellent quality of a large proportion of its articles. To be sure, in many instances the extreme brevity of treatment is disappointing, and even annoying, but the important omissions are few, and no work that we have seen, pretending to cover the same field, with the same limitations of space, has quite achieved its standard of accuracy and usefulness. Almost without exception, works of a similar degree of compression and comprehensiveness have entirely lacked originality; have been indeed merely boiled-down outlines of larger works, the output of a number of fluent hack writers, without any special knowledge of the subjects they are set to work upon. It is a simple matter to test and trace work of this sort by reference to older encyclopædias. An examination of "Nelson's" text shows that it largely escapes this fault, and bears every mark of originality and individuality. Without any great pretension to literary quality, there are, nevertheless, included many articles of scholarly and literary merit. There is nothing to tell who

wrote each article, but the editors have provided a separate list of contributors, from which it appears that the longer articles are largely the work of specialists, or recognized authorities in their respective fields.

Specific errors have been pointed out in previous notices of the work. In general, the most obvious faults appear to be (1) too great a condensation resulting sometimes in vagueness, but oftener in a failure to bring out properly the comparative importance or real significance of facts and events, (2) a lack of proportion from which no encyclopædia is ever free, but which is here possibly more marked as a result of its bi-national origin, and (3) too great emphasis on matters of current or contemporary interest, both as to text and illustration. It should, however, be noted that this latter fact is responsible for one characteristic that in some respects adds to rather than detracts from its value; this is the unusually full treatment of topics of a popular scientific character, which will probably appeal to a majority of those who will make use of the work. The inclusion of many articles and biographies of another sort, some of which have been referred to in previous notices, cannot be so well defended. It remains to be said that the inclusion of this mass of contemporary material has apparently been accomplished without any very great sacrifice of classical, literary, or philosophical articles, although the editors expressly announce that such have been intentionally subordinated to subjects of current interest.

Nowhere, perhaps, is this subordination more strikingly shown than in the matter of illustrations. These, as we have before remarked, leaving out all questions of the appropriateness of many of them in a work of this sort, are, as a whole, poor, and the method of printing them with the text on the back—an obvious space-saving device—makes them appear even worse than they are. The maps, too, are ridiculously inaccurate, an examination showing numerous errors of location and distances, with rivers and lakes misplaced and towns and cities miles from where they ought to be. No great reliance should therefore be placed on the atlas features of the work.

The Epistle of St. Jude and the Second Epistle of St. Peter. By J. B. Mayor. New York: The Macmillan Co. $4.50 net.

The apparent purpose of the Cambridge scholars Lightfoot, Westcott, and Hort to comment on the entire New Testament was unfortunately not realized. Even with the supplementary notes, posthumously published, of Lightfoot on the Pauline Epistles, Hort on First Peter I., 1-II., 17, and Westcott on Ephesians, great tracts remained untouched—the Synoptic Gospels, Acts, Pastoral Epistles, James, Second Peter, Jude, and Revelation. Dr. Swete, however, in his commentaries on Mark (1898), and Revelation (1906), and Dr. Mayor, in his commentary on James (1897), and in the present volume on Jude and Second Peter are ably filling up in part what is lacking in the achievement of the Cambridge school. It is characteristic of this school that questions of literary criticism are secondary to philological and textual considerations. As Dr. Swete in his commentary on the Apocalypse of John tends to minimize the profitableness of the search after literary sources, so Dr. Mayor, while conceding that Second Peter drew from Jude, thinks that it is "superfluous to consider theories which suppose Second Peter to be made up of two independent epistles." The position taken in this volume is confessedly about the same as that of Dr. Chase in his articles on Peter and Jude in Hastings's "Bible Dictionary." The position to which Dr. Mayor has come is this: Jude is prior to Second Peter, was written nearer 80 than 70 A. D., and is the work of Jude, the brother of the Lord. This theory, it may be said in passing, was regarded even by Von Soden, in 1893, as not impossible, and may be called the generally accepted conservative view. Second Peter, on the contrary, though a unity in itself, is dependent on Jude. It is not by the Apostle Peter, and the earliest possible date is 125 A. D. In the light of what has been said on the other side by Spitta, Zahn, Bigg, and Warfield (the discussion of the last-named scholar is apparently unknown to Dr. Mayor), this view, though probably correct and certainly cautious as to the date, cannot be called conservative.

The line of treatment designated in his commentary on James is followed also here. Two hundred pages of introduction and two hundred more of notes, paraphrase, and comments, preceded by the Greek text of Jude and Second Peter (founded mainly on that of Westcott and Hort) conveniently printed in parallel pages, and finally a valuable index of Greek words covering twenty-two pages, indicate the scope of the book. Like all the other works of the veteran classical philologist, his notes here are marked by sound learning and accurate scholarship.

The Persistent Problems of Philosophy. By Mary Whiton Calkins. New York: The Macmillan Co. $2.50 net.

A number of books have been written on the "Problems of Philosophy"; and the title seems in some cases to have been chosen because it does not commit the author to any solution. But Professor Calkins has very definite ideas as to how problems of philosophy are to be solved. This, as the sub-title indicates, is "An Introduction to Metaphysics." It differs, however, from most introductions of the kind in that it is historical, and from most histories of philosophy in that it is critical. There are some obvious advantages in approaching the subject on its historical side. Substance is thus given to the shadow of doctrines by associating them with persons, by showing that the ideas set forth have been really entertained, and by fixing their place in the development of thought. Professor Calkins devotes nine out of her eleven chapters to the exposition and criticism of European metaphysics from Descartes to Hegel. The "conclusion" treats of contemporary philosophy, and presents the author's own doctrine. It contains also biographical sketches of the chief modern philosophers, and an excellent bibliography. In the classification of systems the author proceeds upon a metaphysical principle—the idea of substance. Systems of metaphysics are distinguished accordingly as monistic and pluralistic—that is, those in which substance is regarded as one, and those in which it is regarded as more than one. Each of these classes is subdivided. The monist may hold that substance is numerically one yet qualitatively more than one, as for example Spinoza, who conceived God to be the only substance, and yet recognized in him a qualitative plurality, an infinite number of attributes. These subdivisions are subdivided still further. It is enough here to remark that setting out with such a principle of division, the author does not find it sufficiently elastic. For while the philosophers of continental Europe, from Descartes to Wolff, made the idea of substance the starting point, those of Great Britain during the same period began with a theory of knowledge. In her scheme of classification, Professor Calkins finds it difficult to place Kant, Fichte, and Schelling; but the two last-named philosophers should undoubtedly be put with Schopenhauer and Hegel among the "numerical" monists. It is hard to make a division sufficiently comprehensive to include every kind of metaphysical theory, and yet sufficiently definite to be of value. Had the author classified the successive systems as stages in a development rather than as stationary units, she might have escaped the irregularities and inconsistencies which mar the symmetry of her work.

To expound the metaphysics of modern Eurepe is no light task, but Professor Calkins has accomplished it for the most part in a clear and scholarly manner. Beginners may read her "Introduction" with understanding; and even those who are weary with the confusion of metaphysical tongues will be interested in the freshness of her comment and criticism. The chapters on Descartes and Leibnitz are good examples of the way in which the history of philosophy should be written and the criticism of philosophy performed. The account given of Spinoza is faithful to the text of his writings, but shows neglect of the Jewish sources of his doctrine. The exposition of Fichte is undertaken in such sympathy with that philosopher, that it is almost dramatic. No author writing in English has surpassed Professor Calkins in giving a clear and simple interpretation of Hegel, free from the uncouth language which disfigures most Hegelian commentaries. The least satisfactory chapter is that which treats of Kant. Like many Hegelians, Professor Calkins, we think, underestimates the importance and value of the first Critique, and of the revolution effected by it. Too much emphasis is laid upon Kant's relation to Leibnitz and Wolff, and not enough emphasis upon the crisis in European philosophy that his philosophy was designed to meet. The section entitled "Criticism of Kant's Doctrine of the Necessity of the Categories" shows a strange confusion in the author's mind of universality with necessity; yet she attributes such a confusion to Kant himself. This is not the place to consider the validity of Hegel's metaphysical principles, but the author seems rather blind to their defects, considering her keen eye for flaws in the systems of Hegel's predecessors.

Professor Calkins not only criticises, but constructs, and sets forth her own doctrine with such ability that she should have a distinguished place among contemporary Hegelians. Yet while her additions to Hegel's Logic are no doubt improvements, they

are hardly sufficient to win adherents to the school from among those who will not follow the original teaching of the master. She calls her theory "Personal Idealism," and, as she frankly admits, she owes a considerable debt to Professor Royce. We cannot help thinking, however, that this speculative philosophy built upon Hegelian principles is not much better than the dogmatism of the period before Kant, from which it differs essentially only in its pronounced idealism.

The Life and Letters of Charles Russell Lowell. By Edward W. Emerson. Boston: Houghton, Mifflin & Co. $2 net.

Of the young men whom Massachusetts sent from the flower of her citizens to defend the integrity of the Union and the principles of the North, many came back to enjoy what they had helped to win, and by their distinctions in peace almost cast into the shade their exploits in the field. Others, who won "the great prize of death in battle," are enshrined with "ever-youthful brows" in the memories of their fellow-citizens and the monuments of Boston. The type of these, for Boston, will always be the heroic figure of Robert Shaw. But those to whom Shaw's memory is sacred must bracket with him another of the happy warriors of Boston, a man cast in the same mould, Charles Russell Lowell, the nephew of the poet-critic.

Lowell's life has already been told by the late Professor Peirce in the "Harvard Memorial Biographies." It was the wish of Mrs. Lowell, who died lately, that the editor of this volume should supplement earlier records by his sketch of Lowell's career, and with her permission his private letters are here collected. These were written first from Europe, where Lowell spent two years after leaving Harvard, in the attempt, which proved successful, to cure a weakness of the lungs. Then follow those written in the two years before the war when he was settling down to the trade of ironmaster.

The letters written from recruiting stations and from the field in Virginia, are naturally the most interesting. Lowell was a born cavalry commander, and in three years rose from the rank of captain to that of brigadier-general. He was mortally wounded, after a display of great gallantry, in the battle of Cedar Creek in the Shenandoah Valley campaign of 1864. Less than a year before that he had married Josephine Shaw, and his wife was able to spend some months of their brief married life with him at his headquarters not far from Washington. The most intimate of the letters are addressed to his wife and to his life-long friends, H. L. Higginson and John Murray Forbes of Boston. They are the letters of a man of action, whose mind is set on his individual task whatever it may be, and they reveal a character of great sweetness and courage. The charm of his personality, partly due to unusual good looks, is shown to the reader by some excellent illustrations from photographs. In battle Lowell flung himself into all the risks, and the list in the letters of horses shot under him justified his men in believing that he bore a charmed life. Had he survived the victory of Cedar Creek, Sheridan had intended to make him his Chief of Cavalry, a position in which he would have been much less exposed. Lowell might then have lost the peculiar aureole that clings to the young soldier who does not come back from the war, and these letters would never have been published. As it is they are a touching prelude to the tragedy of early death. They bring home to us the situation, at once so glorious and so cruel, of those who have given their best to their country and receive in return the right to count a hero among their dead. They leave in the reader's mind a sting like that left by Pericles when he said in his Funeral Speech for those who had fallen in the first year of the war with Sparta: "The city has lost its youth; the year has lost its spring."

Science.

Makers of Modern Medicine. By James J. Walsh New York: Fordham University Press. $1.

Books in English on the history of medicine are not as yet so numerous that this one, by a professor of the Fordham University Medical School, may not find a welcome. Much of the matter has already been used in articles contributed to magazines which circulate in rather special circles. Dr. Walsh has drawn from many sources, not always judiciously (certainly not judicially). These sources are often so insufficiently indicated that it is not easy to verify the statements that flow freely from his facile, sometimes almost too facile, pen. The list of "makers" will hardly satisfy all readers, to many of whom Bichat, for example, will seem too great an intellectual force to be neglected, but the sketches of the chosen ones are smooth and pleasant reading, barring a too insistent assertion that they are mostly the product of the direct influence of the Catholic Church. The effort to show that they were "all deeply religious men," in the sense that the author seems to use the phrase, is at best rather labored.

Dates are a necessary and often tiresome evil in biography, but this book would be much improved if they were a little more numerous. In about half the sketches it is difficult to place many important events in the lives or even to tell the death year of the subject. A careful comparison of dates would refute the dictum of the author that practically every great discovery in medicine has been made by men under thirty-five and show that here as elsewhere the tree of knowledge bears many fruits, some of which ripen slowly. A little attention to chronology would also have prevented the confusing statement (p. 123) concerning Galvani, that "in his observations on the effects of lightning he was forestalling Franklin's work to some extent." If this refers to the kite and related experiments, it may be said that Franklin's kite flew at least twenty-eight, possibly nearer thirty-eight, years before the frogs of Galvani twitched, and also at a time when Galvani was not quite fifteen years old! It may further be noted that Richmann was killed by lightning *not* "not long after this time [of Galvani's experiment, 1780-90 (?)]," but many years earlier, to wit, in 1753.

The author also promises a volume dealing with the medical men of earlier centuries, back to the fifteenth. It will be interesting to see how he treats them; there were giants in those days.

George Massee, whose interesting treatise on fungi was noticed in the *Nation* of December 20, 1906, has published a very practical handbook upon a restricted portion of the larger field, namely, the fungal vegetable parasites. This "Text-book of Plant Diseases" (The Macmillan Co.) considers only those maladies of plants which are caused by cryptogamic parasites, leaving untouched the great group of diseases due to defects of nutrition and the like. Mr Massee gives clear directions for combating some of these maladies, so that his work must be of use to intelligent cultivators who wish to keep abreast of the times. The greater part of the subject-matter of his treatise is presented likewise in a practical form by our progressive and untiring Department of Agriculture in its Bulletins. The Department of Agriculture and the different experiment stations in our country are leaving no part of this subject untouched. But it is well for all cultivators to have a synoptic handbook like Mr. Massee's within reach. For Americans it is well to note that a few changes in terminology are necessary, for instance, our word kerosene must be substituted for paraffin (p. 40).

Prof. D. G. Elliot has prepared a "Catalogue of the Collection of Mammals in the Field Columbian Museum" of Chicago, giving under each species the scientific name with synonyms and the common name; also under each specimen the age, sex, locality, and collector. The number of mammals in the collection has increased from a few mounted specimens when Professor Elliot took charge, to 15,000 at the present day. A new species of bat is described, and ninety drawings illustrate some of the lesser known mammalian forms. (Published by the Museum.)

The Société d'Astronomie d'Anvers has just issued its second annual report. Chiefly founded for the purpose of popularizing the study of Astronomy among the inhabitants of the town, the society would appear to be fulfilling its purpose remarkably well. An observatory has been opened, and is used regularly by the members; and, assisted by the city authorities, a course of free lectures is maintained.

F. R. L. Wilson and G. R. Hedley's laboratory manual, "Elementary Chemistry" (Henry Frowde), does not differ in any essential respect from a hundred others. In choosing a laboratory guide the instructor will be influenced chiefly by its adaptation to his text-book, his laboratory facilities, and his allotment of time; therefore, he will be apt to find some American manual which will fit him better than this English one.

Drama.

CLYDE FITCH AS A DRAMATIST.

William Archer, one of the most observant and generally judicious of English theatrical critics, recently pointed to Clyde Fitch as the most striking example of the

advance made by American dramatists. He would have been more accurate if he had described him as the most successful and conspicuous of American playwrights. Mr. Fitch's claim to that title will scarcely be disputed. Since 1891 he has produced more than thirty plays, of which at least two-thirds are supposed to have been highly remunerative, but box-office prosperity, it is needless to say, is no infallible proof of artistic merit. Nevertheless, it does afford presumptive evidence of some uncommon ability on the part of the author in the adaptation of means to ends, and now that negotiations are reported to be in progress for the performance of one of Mr. Fitch's latest comedies in France, Germany, and Italy, it may be interesting to make a swift review of his product in order to get some idea of its actual dramatic value.

This, in comparison with the great bulk of his writings, will be found to be almost inconsiderable. It is only by virtue of two or three pieces, to be specified presently, and a few isolated scenes, that he can be considered—in the proper sense of that much abused word—a dramatist at all. Drama implies purpose, design, the study of human nature, the conflict of antagonistic characters, the logical development of effects from causes, the illustration of eternal principles, the embodiment of truth in action. It concerns itself more in the invisible forces that dominate events than with the events themselves. Mr. Fitch's plays, with very few exceptions, are mere arrangements, more or less dexterous, of incidents designed to amuse or startle, without reference to character, motive, truth, or moral. In external detail they are often veracious, after the manner of a photographic snapshot, being indeed mimetic rather than inventive, but their composition as a rule, is arbitrary, extravagant, illogical, and insignificant.

Some of his earlier plays, such as "The Masked Ball," "An American Duchess," "Gossip," and "Bohemia," adaptations or collaborations, need not be taken into consideration. The extent of his responsibility for them is uncertain. Nor is it necessary to the present object to discuss such ephemeral affairs as "Mistress Betty" (1895)—a grotesque extravagance dignified by the genius of Modjeska—"The Moth and the Flame" (1898)—social functions, interspersed with lurid melodrama—"The Head of the Family" (1898), "The Cowboy and the Lady" (1899), "Lovers' Lane" (1901), "The Way of the World" (1901)—a silly social shocker—"The Girl and the Judge" (1901)—clever, amusing, but tricky, irrational, and shallow—"The Stubbornness of Geraldine" (1902), "The Frisky Mrs. Johnson" (1903), "Her Own Way" (1903), "The Coronet of the Duchess" (1904), "Cousin Billy" (1905), or half-a-dozen others of even less consequence. They were not all devoid of merit by any means. Most of them were theatrically effective; showed a sharp sense of situation, and a capacity for glib, flashy, witty, or satirical dialogue; furnished excellent copies of familiar types, and provided fairly good and varied entertainment but all were marred by extravagance, sensationalism, flippancy, obvious absurdity, or utter triviality. Not one had any dramatic weight or substance. This last remark applies with special force to three adaptations, "Sapho" (1900), a gross vulgarization of Daudet's tale; "The Marriage Game" (1901), a crude version of "Le Mariage d'Olympe," and "The Bird in the Cage" (1903), which were as maladroit in execution as they were abominable in tone.

Of his modern social plays several are entitled to more respectful consideration. In "The Climbers" (1901), with all its excess of melodramatic device—the funeral scene, the confession in the dark, etc.—there was a foundation of truth and purpose, with some effective satire, honest emotion, and realistic sketches of character. But the dramatic value of it was destroyed by the conventionality of a happy ending secured by a suicide. "The Girl with Green Eyes" (1902), originating in a useful dramatic idea, is brightly written, neatly constructed, and contains several striking theatrical situations, but these are obtained only by the sacrifice of almost every probability. Here again the solution of a moral dilemma is evaded by the tamest convention. "The Woman in the Case" (1905), an effort in "realistic" melodrama, is superior to other pieces of its class only in the mechanical cleverness exhibited in its construction. It illustrates the waste of trained skill upon worthless material. "The Straight Road" (1907) belongs to the same category, but is not so well made, though more honest in treatment. "The Truth" (1907) is a mixture of light comedy and sentimental drama, in which a promising character study, developed in spots with much cleverness, is reduced to the verge of absurdity by the author's chronic lack of artistic moderation.

It is only in his remotely historical plays that Mr. Fitch exhibits some of the design and purpose of the genuine dramatist. In his "Beau Brummel" (1890), juvenile and faulty as it is in many respects, the attempt to reproduce the manners and personages of a bygone era is creditable and not altogether unsuccessful. The dying scene is a bit of apt and pathetic fancy. His "Nathan Hale" (1899), rather feeble in design and overladen with trivial matter, is redeemed by a simple and dignified closing scene. "Barbara Frietchie" (1899) shows fertility in the invention of incident, and is, on the whole, an excellent specimen of stage fiction, in general harmony with the assigned period. Many of the incidents, especially the most emotional, are flagrantly theatrical, but the play is meritorious in intent, if not in execution. "Major André" (1903) in general design and sustained quality is, perhaps, the best of Mr. Fitch's achievements up to date. It plays havoc with actual history, and occasionally sacrifices common sense to theatrical trickery, but in the main it is ingenious, sympathetic, atmospherically veracious, and capable. The closing scene is tender, dignified, and poetically imaginative.

This record does not offer much encouraging evidence of development, except in the matter of technical skill. In the invention and presentation of theatrical incident, comic or melodramatic, Mr. Fitch has always been proficient, and practice has made him more skilful in this respect, but, except in the rarest instances, his personages have been mere puppets, made to fit the desired situation. He is an expert in converting current gossip into living pictures. He can copy an individual, but cannot create a type. Circumstance is always his god in the machine. The influence of character upon the order of events rarely enters into his calculations. In all his plays it would be difficult to find one man or woman of moral or intellectual distinction. He alternates between frivol and sensation. He is one of the most adroit of our entertainers, but he can scarcely be called our representative dramatist, while Bronson Howard, author of "Aristocracy" and "The Banker's Daughter," Vaughan Moody, Charles Klein, and Percy Mackaye remain in the field.

Music.

The copyright for Great Britain and the British colonies of a large number of MacDowell's compositions was acquired some time ago by Elkin & Co. of London, who report a steadily increasing sale of these works. In one respect London is even ahead of New York, for at a recent concert George F. Boyd played the Keltic sonata, which has not been done publicly in this city. At the same concert, the *Standard* says, Miss Grainger-Kerr sang "some charming examples of the lyric art of the American composer, MacDowell, which she interpreted most artistically."

The late Charles James Oldham of London was a well-known collector of violins. He owned, among other instruments, four excellent ones by Stradivarius, undoubtedly genuine. In his will he left one of these to the state, unless a purchaser can be found willing to pay $15,000 for it. The date of this instrument is 1690, and it was sold in 1888 for $5,000. Another of the Oldham violins, valued at $5,000, he bequeathed to the British Museum. Not a few foreign journals have taken this occasion to inveigh once more against the "stupid egotism" and "criminal mania" of rich violin collectors, who prevent the musical public from enjoying the finest instruments in existence.

While in Paris recently to conduct his 'Salome," Richard Strauss gave to a journalist a brief sketch of his career and a confession of faith. He began to compose when he was only ten years old. Five years later his first symphony was performed in Munich, under Levy. Six years after that, Hans von Bülow put him at the head of an orchestra. Among the composers who first influenced him were Haydn, Mozart, Beethoven, and Schubert; but above all, Mozart. He was eighteen when he first felt the spell of the music of Wagner and Liszt, as well as Berlioz, and these three men became thenceforth his models. He said, in speaking of Berlioz:

> In the main, I endeavored to derive from French music those things which are most wanting in the German, certain airy, graceful, charming *finesses*, as exemplified particularly in the score of "Carmen," which presents such a strong contrast to the serious heavy style from which the German composers find it so difficult to get away.

Strauss did not seem to realize that no German composer is quite as many miles away from the "airy, graceful, charming *finesses*" of "Carmen" as he himself. Regarding his new opera, "Electra," he said that two acts are already completed.

There was a time when the guitar was the most popular of parlor instruments, especially for accompanying songs. Most of Weber's Lieder were written with guitar accompaniment. Of late there has been a decided reaction in its favor in Germany. It started with the concerts of the Swede, Sven Scholander, who used a lute which really was a kind of guitar, with hollowed back. To-day there is quite a demand for guitars and guitar music. No doubt the revival of interest in folk-song has something to do with this; for folk-songs sound better with guitar than with piano accompaniment.

The latest history of music in German is by F. Spiro. It is thoroughly unconventional. He calls Clara Schumann "a piano gosling," and says that Brahms is "the typical representative of the industrious German middle class."

All records have been beaten in Vienna by the operetta "Die Lustige Witwe" (the Merry Widow), which has been sung there consecutively more than 400 times. The four-hundredth performance was the occasion for a great ovation to the composer, Herr Lehar, and all the singers.

Art.

Antonio Pollaiuolo. By Maud Crutwell. Imported by Charles Scribner's Sons, New York. $2 net.

In a brief prefatory note Miss Crutwell states that "this is the first book devoted to Antonio Pollaiuolo that has been published in any language," and acknowledges her indebtedness to Bernhard Berenson's study of the Pollaiuoli, in his "Florentine Drawings of the Renaissance," as to the chief, and almost the only, writing of importance on the subject. Ever since Vasari made certain demonstrable blunders in his account of the brothers, the works of Antonio have been so confused with those of Piero, and both with the works of others, that it was apparently reserved for Mr. Berenson to make a beginning in disentangling the two individualities, and in demonstrating that Antonio was a great artist and his younger brother little more than a not very competent assistant. This task Miss Crutwell has now taken up and carried into greater detail, differing with Mr. Berenson now and then on this or that minor matter, as was to be expected, but carrying out her work on the large lines laid down by him. Her study is careful, intelligent, for the most part excellent. Its faults arise from a too great admiration for her hero, which leads her into frequent exaggeration of praise and, finally, into what we are inclined to regard as a grave error.

However careless or untrustworthy as to matters of fact Vasari may have been, he was an excellent critic, and his praise is usually both intelligent and just. His estimate of Antonio is nearly perfect:

> He understood the nude in a more modern way than any of the masters before him. . . . He was the first to study the play of the muscles and their form and order in the body.

That is a very precise definition of the quality of the master. He was a man of scientific and realistic temper, little concerned with beauty or sentiment, interested in mastering the human figure and in expressing its substance and its movement, the pathfinder for the glorious masters who came after him. But Miss Crutwell is not content with rating him as one who "understood the nude in a more modern way than any before him"; she will have it that he understood it better than any one before or since. "Not even Signorelli nor Michelangelo have equalled him," she says; certain works she calls "worthy of the sculptor of the Parthenon reliefs"; and of the reliefs on the tomb of Sixtus IV. she remarks: "Never has the female nude been at once so exquisitely and so scientifically modelled," and "certainly no other sculptor has combined so exquisitely its possibilities of grace and strength." Her text is full of allusions to his "faultless drawing," his "faultless anatomy," his "perfect proportions." Now all this is, asking pardon for the rudeness of the phrase, arrant nonsense. Antonio Pollaiuolo never did a faultless figure in his life, nor anything like one. In drawing, engraving, painting, sculpture, he produced many figures. Energetic they are, vital, full of force and movement and life, but faultless is what they are not. They are rather ungainly, ill proportioned, ugly. Now and then they approach beauty, but now and then only, and perfection they never touch.

Such excess of enthusiasm is, however, not unknown in other monographs, and in itself is harmless enough. Most readers will be able to supply the necessary grain of salt. But this ill-regulated admiration has led Miss Crutwell to a conception of the relations between the two brothers, and of their respective share in the work undertaken jointly by them, which we find quite incredible. Ardently admiring Antonio, and having little but contempt for Piero, she must needs give to the elder everything of good in their joint works, and to the younger everything faulty. So, when she finds the mirror and serpent in the hands of the Prudence of the Mercantanza better executed than the figure, instead of reasoning, as Berenson does of the background of the Annunciation, that this is just the kind of thing an inferior man could execute well, she concludes that Antonio painted these details himself. She likes the landscape backgrounds, with the Arno winding through its valley and under the walls of Florence, which occur in many of the pictures of the Pollaiuoli, and concludes that Antonio painted these, even when they are incidental glimpses through a window in the background of a composition showing, otherwise, no touch of his hand. She has reduced all this to a theory and propounds it categorically. "He seems in all their joint work to have reserved to himself only such parts as interested him," and that he was specially interested in landscape "is proved by the fact that, while leaving to Piero the principal figures in his pictures, he himself painted with the care of a miniaturist the background scenery." We are asked, in a word, to believe that the greatest figure draughtsman of his age (or, as we are told, of any age), a man of fiery energy, a student of anatomy, who dissected many cadavers and who valued subjects only as they afforded opportunity for displaying the nude in violent action, a goldsmith by training, a sculptor by preference, amused himself by painting "with the care of a miniaturist" bits of landscape between the legs of figures drawn by an incompetent younger brother! One can as easily imagine Michelangelo doing the same thing.

Surely, a more rational theory of the collaboration of the two Pollaiuoli than this must be attainable. Without pretending to the perilous honors of modern connoisseurship, with no facilities for the proper study of the works involved, relying only upon the data afforded by Miss Crutwell herself and by Mr. Berenson, and the reproductions published by them, we are tempted to suggest an alternative hypothesis which may be worthy of investigation by some one competent for the task. That hypothesis is, in brief, that Piero was the landscape painter of the family, that the characteristic view of the Val d'Arno appears only in works in which he had a share, and that it is uniformly executed by him.

There is certainly no inherent improbability in the notion that the inferior figure-painter should be the superior in landscape, and there is nothing in what we know of the character of the two brothers to negative the supposition that the placid distances, which contrast so strongly with the savage energy of the figures in front of them, were the work of the weaker and milder man. Miss Crutwell dwells upon the striking difference in type of the portraits upon their tomb in San Pietro in Vincoli, comparing Antonio's head to those of Mantegna and Signorelli. It reminds us of that of Ingres also, with its great nose, its high cheek bones, its forcefulness, and its austerity; and it reminds us, more than all, as Mantegna and Ingres often do, of some aged Indian chief. But for the broken nose and the beard, which disguise the resemblance, Michelangelo had a head of the same family—the typical head of the severe masters of form. Piero's is as different as possible—"timid and fretful," Miss Crutwell calls it, "with its weak mouth and vacillating expression"; mild, certainly, and somewhat sentimental, gentle, and with a vague, brooding look about the eyes, gazing off into the distance with a dreamy look altogether in contrast with Antonio's concentrated glance. It might well be the head of some modern lover of nature in her sweeter moods; it could never be the head of a great draughtsman.

All this may be purely fanciful, however, and proves nothing. Let us consider some concrete facts. And first, note the almost entire absence of distance, or even of what may be called a background, in the works that are accepted as entirely by Antonio's own hand and as most characteristic of his genius. The frescoes of the Villa della Gallina, in the grounds of the Torre del Gallo, Arcetri, near Florence, are much dilapidated and repainted, but they seem never to have had anything but a flat tone behind the figures, which detach themselves against it in a pattern of nude forms much as an antique sculptor would have designed a frieze. Such is the treatment, also, of the drawing in the British Museum of a Prisoner Brought before a Judge, the figures in almost pure outline, relieved against a flat wash which represents nothing—the plane surface of the sculptor in relief. In the Battle of Ten Nudes we see

the goldsmith, the ornamentalist, the worker in niello, rather than the sculptor. The background is a closely interwoven thicket of trees and vines treated in a wholly conventional manner, a piece of intricate decoration rather than a representation of nature; and the whole plate is, with evident intention, kept entirely flat and without suggestion of distance. This is Antonio's method when he is entirely free to do as he chooses—to leave the background out entirely or to make of it a mere pattern. When he has to tell a story he must give it a setting, and his designs for embroidery, where Piero probably assisted him, have glimpses of landscape, rigidly subordinated, however, to the figures. Whenever it is at all possible, he substitutes architecture for landscape, and treats it in a very formal way. So, in the relief for the silver altar, there is the necessary architectural setting in the tradition of Ghiberti, though he seems never to have attempted landscape in bronze as Ghiberti did; but in his most mature and most magnificent work, the tombs of Sixtus IV. and Innocent VIII., he returns to the purely sculpturesque tradition, and his reliefs have no perspective and no distance. Only something rudely symbolical of rocks suggests that some of the figures are supposed to be out of doors.

Of the paintings attributed to Antonio alone, two are supposed by Miss Crutwell to be so early as to exclude Piero's collaboration, the David of the Berlin Museum and the Apollo and Daphne of the National Gallery. If the latter is really as early as she thinks it, our suggestion is disproved. But the David, striding over the head of Goliath, is painted "against a slate-gray wall." The earliest picture in which she recognizes, as does every one, the hand of Piero, is the SS. James, Vincent, and Eustace, painted in 1466, when he was about twenty-three years old. Two of the figures certainly, all of them possibly, are partly or entirely by Piero. Between them are narrow strips of landscape, a few inches wide, the characteristic Pollaiuolo landscape with its winding stream. We meet it constantly after this, nowhere more characterized than in the glimpse of distance seen through the window behind the Annunciation, a picture in which not even Miss Crutwell finds any other trace of Antonio's hand. The S. Mary of Egypt, however, at Staggio, which she believes to be entirely by Antonio, has a different style—a rocky cave as purely symbolical and antinatural as a background of Giotto's. It is true that there seems to be a bit of distance, in the left hand lower corner, which resembles the Val-d'Arno landscape we are familiar with, but less well done than usual—if Antonio was indeed dispensing with his brother's assistance on this occasion, he may have done it carelessly himself.

But the crux of the argument is to be found in the two little pictures of Hercules and the Hydra and Hercules and Antæus, now in the Uffizi, and their relation to the large pictures of the same subjects known to have been painted for Lorenzo di Medici in 1460 by Antonio, with the assistance of Piero, then a youth of seventeen. The small panels are considered by Berenson to be preliminary studies for the large pictures, but Miss Crutwell argues, very successfully, that they are independent versions, thinking it likely, however, that they were painted "about the same time"; and she goes on: "They belonged to the Medici collection, probably to Lorenzo himself, and it may be that he valued them so highly as to order them to be copied on a larger scale." In either view the little panels would be earlier than the lost pictures with which they are connected. Why should they not be later, free replicas made for some other member of the Medici family from the large canvas belonging to Lorenzo? Miss Crutwell's arguments for the independent nature of the smaller pictures seem to us to point to this conclusion, although she does not draw it. Her reasons are these:

Among the engravings of Robetta are two, of the Labors of Hercules, which have been generally accepted as copies of the small panels, but which differ from them in many points, and which seem likely to be copies of the lost pictures, as Robetta would be unlikely to make such grave changes himself, or variations so much in the manner of Antonio's own work. In the Antæus there is a strange figure of a child which has no apparent reason for being there, and which we can hardly conceive of as added by a copyist. The figure of Antæus himself is awkwardly arranged, without any foreshortening of the limbs, and is altogether more primitive in manner than in the little panel. In the Combat with the Hydra there are also several variations, notably in the pose of Hercules's left hand (which does not grasp the Hydra's neck, but is only stretched out toward it), in the less happy composition of the lion-skin, and in the drawing of the Hydra itself, and most of these differences are supported by an old drawing in the Louvre and by Antonio's own sketch in the British Museum. What Miss Crutwell does not note is that the pose of the left hand in the engraving, bent back upon the wrist in a peculiar manner, is strikingly characteristic of Antonio, occurring in his drawing of Adam in the Uffizi, in two of the figures in the Prisoner brought before a Judge, and in the Torre del Greco frescoes. But all these differences are slight compared to those in the backgrounds. In the little pictures the figures are posed, in the characteristic Pollaiuolesque way, upon a foreground eminence, with no middle distance, and loom large against a distant landscape with a winding stream, upon which we look down as from a height. In the engravings everything is different—there is nothing but shapeless dumpling-like masses of rock, piled so high, in the Combat with the Hydra, as utterly to dwarf the figure, and pierced with a cave somewhat resembling that of S. Mary of Egypt.

All of these differences are in favor of the smaller pictures as the more mature and well-considered works, but this is especially true of the difference of background. It is inconceivable that the painter who had once made his figures tower against the distance as these do should afterward substitute the clumsy lumpiness which stands for the earth in the engravings. In our view, then, the small panels were painted some few years after the large pictures, and the figures were revised and improved by Antonio himself. In the backgrounds he let Piero, who had already, as we know, some slight share in the larger works, try his hand, and, being pleased with the result, called him in thereafter when landscape was to be treated, though he did without landscape when he could. The background of the Hercules and Antæus would thus be probably the earliest of Piero's attempts at the painting of distant landscape, that of the Hercules and the Hydra being already somewhat more mature, though neither of them is equal to what he afterwards did in pictures otherwise very inferior.

One difference between the two versions of the latter subject we have failed to note. In the engraving, as in Antonio's sketch, the club of Hercules "breaks out in flame," as Miss Crutwell, following Mr. Berenson, expresses it—in other words, he wields the burning brand with which, if we remember aright, he seared the Hydra's necks to prevent the heads from growing out again. Was it from negligence, or as a concession to the common notion of Hercules, that, in the smaller version, this detail was omitted and a plain club substituted for the flaming one?

In "Stories of the Italian Artists" (E. P. Dutton & Co.) E. L. Seely pretends to give no more than a translation of the best narrative parts of Vasari without notes or corrections of that writer's misstatements. As such, its utility to-day may be doubted, but it may, of course, afford innocent amusement. The book is handsomely printed, and the illustrations, including eight in colors, are well executed. In the more primitive work, especially, the addition of color is a real help to understanding; in the more advanced work the gain is doubtful, the coloring of advanced painters not being at all imitable by the processes used. The text is "wholly revised from a previous publication."

The death of Prof. Carlo Ferrario, at the age of seventy-three, is announced from Milan. Professor Ferrario had for many years been teacher of perspective at the Brera Academy. He was himself a distinguished painter.

Finance.

"SHORT CROPS" AND PROSPERITY.

Attention has already been called, in this column, to the jeopardy in which the season's abnormal weather has placed the grain crops, not only of this country, but of the entire world. The controversy as to probable results is not yet over, and probably will not be over until the late wheat crop of the Northwest has passed through the trial of the autumn frosts. Meantime, "private estimates" have been given out by experts attached to speculative grain houses; one of such estimates, not very long since, declared that the winter-sown wheat crop of the Southwest and Middle States could not yield more than 325,000,000 bushels. This would compare with 405,000,000 bushels deduced from the Government's "condition estimate" of May 10, and with 492,000,000 actually harvested last year.

That private estimate came on a market where speculation for the rise had been overdone, and it found few believers. Generally, it was felt in the trade that,

although the crop weather since May 10 has by no means been of the best, still it has improved on that of the preceding month; indeed, since the estimate in question was published, the price of wheat for July delivery has declined 6 cents per bushel. On Tuesday of this week, the Ohio State Agricultural Department, which at the opening of May gave out a winter wheat condition estimate of 74, marked up the figure to 77.

Next Monday, the national Department of Agriculture will submit its June report on the country's winter-wheat crop as a whole, and this will in some respects be the last word on the actual present situation. If the estimate is raised from the 82.9 per cent. to which it was reduced from the 89.9 of April, apprehensions will be definitely relieved. Of still greater importance will be the Department's estimate of the same date on the "spring wheat crop" of the northerly Middle States and the farther Northwest. The difficulty of planting grain in the cold and stormy weather of May—during which month all the later wheat ought to be placed underground—has led to apprehensions of an acreage much reduced from last year's 17,354,000 acres spring wheat area, of a "condition" far below the excellent showing of 93.4 in June, 1906, and consequently of a crop promise 100,000,000 bushels or more below the 242,700,000 harvested in those States last year.

The verdict on these two crops we shall know four days from now; meanwhile, the extraordinary weather has had its influence in other directions. The cold storms happened to come at the very hour when the cotton crop of the Southern States was planting. From Texas to North Carolina, the fortnight between May 1 and May 15 usually sees the completion of planting; this year, no such dates could be observed. Southern correspondents of an important cotton organ have declared this to be the most "backward" of cotton seasons since 1855.

From a price of not quite 12 cents a pound, on May 14, cotton advanced at New York, by the 31st, to 12⅞—a higher price than any reached since the famous "Sully corner" of January, 1904. Alarming estimates of probable shortage in the crop—put out, as usual, in the interest of speculative houses—at once became current. The Government's first "cotton condition estimate" of the season was to appear last Tuesday, June 4; three or four days earlier, the "private experts" of the Cotton Exchange pressed matters to a climax by publishing a condition percentage estimate of 63.4. What such a condition would mean may be judged by comparison with the June estimates of previous years. The lowest figure named by the Government this month, in a quarter of a century, was more than 10 per cent. above it. The Cotton Exchange, taking its cue from this absurd guess of an irresponsible calculator, framed expectations of its own ranging from 60 per cent. to 68. The Government's Tuesday estimate named 70½ per cent., and down came the inflated price of cotton.

But 70½ is still a very low June indication, precisely as was the 82.9 for winter wheat. No June estimate in twenty-five years has been so unfavorable; it is 14 per cent. below last June's. The acreage is unchanged, according to the Government, and less than 5 per cent. larger according to the most trustworthy trade publication; therefore, if the June promise were to hold good, a crop one-half to three-quarters of a million bales below last year's might be expected, and this would probably fall short of the cotton manufacturing world's normal requirements. It is, however, entirely too early to make such a prediction, since the very fact that cotton was hardly planted, at the time of the Government estimate, means that the Department of Agriculture's figures were imperfect. With good growing weather from now forward, the plant which was not above ground at last month's close ought to be in better condition than the plant which was. Still, the fact must be recognized that with cotton, as with wheat, existing circumstances are not favorable. Exactly what, then, would a general shortage of our grain and cotton crops mean to the American situation?

Next to the probably lessened purchasing power of the people, the most immediate effect would be on the country's export trade. In 1906, when all the crops were large, we exported $107,000,000 worth of wheat and flour, and no less than $412,600,000 worth of cotton. Our total merchandise exports of that year were $1,798,000,000; so that these two great staples made up very nearly one-third of the entire outward trade. Now it does not necessarily follow that a diminished crop would reduce this showing disastrously. In the case of cotton, for instance, the crop of 1903 was wholly inadequate for the needs of the world's manufacturers; yet Europe, whose own supply was very low, and which had to have the cotton, paid such prices for it that, although our exports from the crop were 657,000 bales below those from the crop of 1902, the value of the exports was actually $66,000,000 larger. But this was exceptional. The wheat shortage of 1904 had a very different outcome; it cut that year's breadstuffs exports down no less than $100,000,000. In the case of cotton in 1903, the crop, though deficient for the full needs of the world, gave enough to spare a larger number of bales for export than in any year prior to 1898. In the wheat market of 1904, we had so little left over, after providing for the needs of American consumers, that the number of bushels exported was much the smallest since 1869.

When one asks, how such influences would operate, in case of a serious crop shortage this year, the answer is not at all easy. Europe's requirements, from our short cotton crop of 1903, were unusually urgent—a series of more or less deficient harvests had depleted the stock in every manufacturer's hands. The present situation is not quite analogous. Since 1903, the world has raised two cotton crops of unparalleled magnitude; last week, the world's "visible supply" was a million and a half bales greater than at this time four years ago. With wheat, on the other hand, the case of 1904 was that Russia increased its own crop almost exactly in proportion to our shortage, so that the world's needs were provided for, notwithstanding the American deficiency. When Chicago raised the price of American wheat, Europe simply ceased bidding. But, so far as appearances indicate to-day, Europe's own wheat crop of 1907 is likely to be quite as deficient as our own, and may possibly turn out much more so. In other words, foreign needs for our cotton are likely this year to be much smaller than in 1903, and foreign needs for our wheat much larger than in 1904.

Two Novels Fit for Nation Readers

ALICE-FOR-SHORT

By WILLIAM DE MORGAN,

Author of "Joseph Vance."

A novel of English life of unusual power and originality. 575 pp. $1.75.

GROWTH

By GRAHAM TRAVERS,

Author of "Mona Maclean."

A novel of student life in Edinburgh. "Throbbing with the tragedies and comedies of real men and women."—*N. Y. Times Review.*

HENRY HOLT & CO.

The Nation.

NEW YORK, THURSDAY, JUNE 13, 1907.

The Week.

Senator Knox is a solemn as well as an able man, and he naturally takes his endorsement for the Presidency by the Pennsylvania Convention with great seriousness. Any candidate having a comfortable nucleus of sixty-eight delegates to start with, might be excused for thinking that he had begun well. But there is no sign that people the country over regard this Pennsylvania manœuvre as anything but a little diversion, or else a scheme for tying up the delegates from that State in a way to make them highly useful for trading purposes in the National Convention. This was long the fashion under the Cameron dynasty, as later under Quay; and the Penrose machine is a good imitator. Tradition and precedent are of great power in politics, and two obstacles of that sort confront Mr. Knox's ambition. First, there is the rule, now amounting almost to a superstition, that no man can hope to go from the Senate to the White House. Garfield was elected President after he had been chosen Senator from Ohio, but he had never sat in the Senate. Is Knox to succeed where Clay and Webster and Blaine and Sherman failed? Still more formidable is the difficulty of a purely modern sort. Senator Knox has had a long career as a corporation lawyer; and his candidacy would be exposed to the troublesome question which President Roosevelt put in the case of Mr. Root. It was, in effect: "I think most highly of his abilities, and feel that he is admirably fitted to be President; but do you really think a corporation lawyer could be elected?"

It appears that Secretary Root is to extend to French chambers of commerce, in addition to German, the right to have their certification of the value of exports to this country accepted, *prima facie*, by our appraisers. This is coolly announced, as if it were not a betrayal of one of the very citadels of protection. The Department of State talks lightly about the "antiquated methods" of our customs officials in taking for granted that every importer is a perjurer; but if a system is to be given up simply because it is obsolete or barbarous, what safety would there be for our most venerable protective practices? The idea of taking a foreigner's word on any subject is repellent to every patriotic American mind, but to believe him when he swears to the cost of the goods which he wants to sell us, and which we want to buy, is enough to bring Dingley from his grave, and cause the Protective Tariff League to tear out its hair by handfuls. It is heartlessly stated, in Secretary Root's behalf, that any manufacturers in this country who question the validity of his order making it easier to import honestly, may take the matter into the courts. Any such legal recourse, it is added, "will occasion no annoyance to the Administration." A Republican Administration not annoyed by a suit showing that it had been faithless to protection! *Wanken auch die Berge?*

The proposed absorption of the Boston and Maine Railroad into the New York, New Haven and Hartford system, as set forth by President Mellen in his letter to Gov. Guild of Massachusetts, is interesting for several reasons. For one thing, the scrupulously careful explanation of the plan by the New Haven's president, his repudiation of any purpose of stock inflation, and his pledge of better service by the line to be acquired, contrast very favorably with the course pursued in other and recent railway "deals." No less admirable, as a model for public bodies to follow in their dealing with such matters, is the course which the Governor advises the Massachusetts Legislature to pursue—to see that Mr. Mellen's offers are "crystallized into law" before the merger is authorized, because "this promise is contingent on the life and health of a single man, or at best of an existing board of directors." If the Legislature is to give its assent, the advantage of such a policy, in comparison with the unfortunately far more familiar legislative policy of "letting a deal go through" unrestrained, and then attacking the financial arrangements when they have already passed into fact, ought to be manifest. From the point of view of traffic facilities, little question is likely to arise as to the advantage of the proposed combination. The Boston and Maine has never attained the standing of an up-to-date railway; its stations, equipment, and train service are of a sort which belongs to a past generation. It is also rather conspicuously true that the two railways are, from their geographical situation, connecting, and not competing systems. The one serves the district north of Boston, as the other serves the district south of it. That the financial aspects of Mr. Mellen's plan should be considerated with jealous scrutiny is, however, natural and proper. The memory of the spectacular and ill-fated "absorption" of Boston and Maine and intermediate lines by the Philadelphia and Reading in 1892, has not yet entirely faded away; the example set by certain railway mergers outside of New England is even more fresh in the public mind, and the existing situation in the money markets is not such as to command approval of a policy involving wholesale outpour of new securities. All this explains why Mr. Mellen so carefully sets forth that no "stock-watering" is involved, and that the plan proposed involves merely exchange of new stock of the New Haven, share for share, for such old Boston and Maine stock as is to be acquired.

Last week the Bureau of Agriculture gave out its estimate of the cotton crop; Monday of this week it gave out its monthly estimate on grain. The cotton estimate of 70½ was more favorable than that of private experts, but was, nevertheless, the lowest June forecast in a generation. It attracted less serious attention, however, because, with the season late and cotton hardly planted, no accurate "condition" estimate was possible by any one. With wheat, the case was different. The April estimate of 89.9 per cent. on the winter-sown crop was not unfavorable; in May, however, it was cut down to 82.9, and an unusually large acreage was shown to have been abandoned. The report of Monday allotted this same crop a condition of 77.4. Spring-sown wheat, for which the Government made its first estimate on Monday, showed up better in one respect and worse in another. The condition was 88¾; but the acreage planted to spring wheat, like that of winter wheat, had decreased on account of the bad weather something like a million and a half acres. The probable total wheat harvest, on the basis of these June returns, is 100,000,000 bushels below the great harvest of last year, and considerably less, with two exceptions, than in any year since the "agricultural boom" began in 1898. Those exceptions, 1900 and 1904, are known as "short-crop years"; the troubles of the grain fields excited much financial uneasiness at the time. Yet it is rather an interesting fact that each of those two shortages was followed by a prosperous year in trade. This event, of course, occurred in spite of the crop results, and not because of them. But the fact that thus far in the season the outlook is for no greater damage to the crops than occurred in the years in question ought to allay uneasiness. Meantime, very much depends on the weather between now and harvest.

It is evidently the purpose of the defence in the Haywood trial to weaken the force of Harry Orchard's amazing confession implicating the defendant by showing the man to be capable of any infamy. Its logic is that a man who confesses to murder, arson, theft, bigamy,

treachery to his associates, and other crimes besides, would not stick at perjury if by means of it he could drag down with him others against whom he might bear a grudge. Whether Moyer, Haywood, and Pettibone were implicated in the Steunenberg murder is the very question which this trial is being held to answer. The tactics used by Richardson and Darrow to discredit the witness may be wise from the standpoint of the criminal lawyer. But the revelations of Orchard's incredible baseness are made side by side with disclosures regarding his close relations to the inner circle of the Western Federation of Miners. Unionists generally have insisted on treating the defendants in these Idaho prosecutions as martyrs for the cause of Labor. What their organization represented and countenanced is of wider real importance than the verdict upon a single murder. The sympathy which Sherman Bell's acts and speeches won for the miners' side in 1904 has been quickly offset by the testimony at Boisé, even if it accomplishes nothing more.

"Individualism," says M. Paul Gaultier in the *Revue Bleue*, "is passing *un mauvais quart d'heure*." The anti-individualistic theories have been reinforced by the biologist. The Darwinian theory, to be sure, with its ideas of the struggle for life and survival of the fittest, implies the paramount importance of the individual. Yet contemporary evolutionists are exalting "the group" at the expense of its members. But this theory is vigorously attacked by M. Gaultier. He denies that there is an analogy between societies and living organisms. Society is not like a plant or an animal, with distinct and centrally directed functions. A cell cannot pass from one organism to another, nor belong to a plurality of organisms. Yet members of one social group can be transferred freely to another. Churches, civil societies or families, can lose some of their members; and the latter, while ceasing to be members, may still survive. Such freedom and independence are foreign to physiological conceptions. And, in general, the theory is prejudicial to liberty. In the church, it breeds intolerance and suppresses free inquiry and independent thought. In the state, it neglects the interests of the individual and subjects him to civil and party tyranny. Indeed, the motive which leads men to become Socialists defeats the end which they have in view. Men do not become Socialists primarily—in spite of what they may say—for altruistic, but for egoistic reasons. Like Nietzsche, that individualist *par excellence*, the Socialist has in view the unfolding and assertion of self. In the words of M. Palante: "The root of Socialism is individualism, the protest of the individual against existing economic tyrannies, the desire to give freer course to the economic egoism of each man." But with its anti-individualistic conception of society, Socialism ends by destroying the liberty which it set out to achieve.

Madame Nordica's proposal to found an American Bayreuth on the Hudson gives evidence of this country's extraordinary musical development. Such a project could not have been considered even ten years ago; but now that New York seems willing to support two grand opera companies, Madame Nordica's ambitious plan may be feasible, particularly if it is combined with a great music school, as is suggested. It is questionable, however, whether New York has not already music schools enough; if this part of the plan has really been decided on, it ought to be at least asked whether there could not be coöperation with one of the existing institutions. Such a musical Walhalla as Madame Nordica proposes would, of course, have to depend upon tourist travel from all parts of the country, but as New York is becoming more and more of a summer resort, this would be but another attraction, and might give a good many people from North, East, West, and South the opportunity to hear opera, which they now lack by reason of their inability to reach the city during the winter months. Munich has found its summer music festivals of great value to the city financially and artistically, while in no wise injuring Bayreuth; and this city might have a similar experience.

Before the Phi Beta Kappa at Cornell, President Eliot discussed the difficult subject of "Academic Freedom." He himself has always been president in fact as well as in name; but he defends vigorously the rights of the college teacher against intrusions on the part of those in higher authority. Of special interest are his remarks on the interference by "barbarous boards" of trustees, who "exercise an arbitrary power of dismissal." He thinks that instructors should hold office without express limitation of time, and should be removed only for incompetence or misconduct. At certain universities the authority of the president over the professors has been enlarged, and in at least one institution he has the power of removal. President Eliot thinks that this control should never be exercised; and in this opinion all college teachers will concur. It is, of course, highly important that there should be no dead wood in a college faculty; and, theoretically, the president as an impartial judge might be held responsible for the efficiency of the teaching staff. But experience has proved that personal feelings may impair the president's judgment; while defects of temper and manner may lead an otherwise excellent professor to incur the enmity of his chief. The capital of a scientific man is, in part, his academic reputation, and it should be guarded and not left to the precarious judgment of one man.

The Hartford *Courant*, though controlled by a member of one of the Yale societies, has ventured to raise its voice against the sacred institution known at New Haven as "tap day." Formerly, the students elected to senior societies were informed privately; but now the custom of "tapping" the successful young men in public is said by the *Courant* to be a "cruel and spectacular sport." Even in so democratic a university as Yale, distinctions created by the existence of fraternities are inevitable. If a student's election to any one of the senior societies depended on his scholarship, athletic prowess, or both, there could be no trouble or envy. When, however, membership is merely a social distinction, to make "tapping" a public ceremony is invidious. The wonder is that there should always be so large an attendance of undergraduates to witness the triumph of the few and the discomfiture of the many.

From a responsible source we have a list of subjects actually assigned to school children of this city, between twelve and fourteen years, upon which they are to write "essays" or get up "debates." Among them are the following: "The Influence of the United States Upon the World's Diplomacy," "Daniel Webster's Speeches," "The Constitution of the United States," "Resolved, That any infringement upon the dual interpretation of the Constitution of the United States should be regarded as a menace to the stability of democratic institutions," "State Rights," "Something against National and State Sovereignty," "American Coinage," "Trade in the East during the Fifteenth Century," "Liquid Air," "Educational progress in the United States from the Civil War up to the present time," "Economic development of the United States from the Civil War up to the present time," "Early Roman Law," and "Was Brutus justified in killing Cæsar?" It is difficult to believe that mere stupidity accounts for "educational" practices of this kind. Nor is it easy to accept the defence of certain teachers that they know the topics are beyond the grasp of their pupils, but that the children are morally, and to some extent intellectually, benefited by the effort to get from books some knowledge about them. The child who is conscientious enough to go to a library and try to puzzle out these subjects will come presently to hate the sight of all books. Moreover, the only way in which chil-

dren are able to use books in "preparing" for debates or essays upon such themes is likely to lead to demoralizing habits. To force a child to make such use of books is too apt to result in shameless and habitual plagiarizing.

A sign of the scientific awakening at the English universities is the recent establishment at Cambridge of a diploma in anthropology. This is offered to advanced students who have been under the Board of Anthropological Studies and have presented a thesis. Considering the extent of the British Empire, the home universities, with the exception of the University of London, have been singularly inactive in this department of scientific research. The leading English anthropologists, Darwin, Huxley, and Tylor, did their work without encouragement from Oxford and Cambridge. Ethnic psychology, to which Germany since the time of Kant has made so many important contributions, is neglected in England, unless one may regard as scientific contributions the reports brought back by travellers and hunters. And yet a very useful source of knowledge concerning the race in the past is to be found in the study of inferior types in the present.

It is plain from Campbell-Bannerman's recent speech that the Liberal Government means business in trying to reform the House of Lords. The Premier will make a statement on the subject in the Commons next week, or the week after. Sir Henry spoke with much feeling of the way in which the Ministry's programme, especially in educational matters, had been broken down by the Lords, and truly said that it was in their power, under present conditions, to make of any Liberal Government merely a shadow. Referring to the frustrated hopes of his party, the Prime Minister said: "We over-estimated our powers." Whether they are not doing it now is the unpleasant question which suggests itself. If the Lords can throw out any bill, except one carrying money, they certainly can throw out any bill to end their right to throw out bills. So it looks very much as if the Liberals would go up against a stone wall. Still, as many Conservatives, even among the peers, are in favor of reconstituting the upper chamber, it is possible that a moderate measure of reform will be at least discussed on its merits.

The recent mutiny of the fourth squadron of the Russian Hussars of the Guard at Tsarskoe Selo may, as alleged, be due solely to too strict discipline—but it may very well be due to other causes. The Russian troops were not in the habit of rising against their officers prior to the war with Japan, but were accustomed to endure hardships and ill-treatment without grumbling. That the revolutionary propagandists are making headway in the army cannot be doubted. Recently the Government has had some success in arresting a few comparatively unimportant agents of the society which is devoting itself to proselyting in the army, but if the latest advices received by the Berlin press are correct, the real leaders are still at liberty, and the full extent of these activities has not been as yet revealed. The society dates back to 1905. After the armed revolt in Moscow, the labor party's leaders determined to win over the troops, if this were in any way possible, and they quickly brought about risings in the Moscow garrison. The revolts in Sevastopol, Sveaborg, and Cronstadt are all attributed to the same source. After their failure, the society went about its task even more systematically. Besides publishing documents and pamphlets without end, it maintained three newspapers, the *Soldier*, the *Soldier's Messenger*, and *The Barracks*. So extensive was the circulation of these journals that the police were finally stung into action, and succeeded in discovering in St. Petersburg and elsewhere a number of secret printing shops in which the papers were prepared. Some of these have been raided; but the chief workers invariably escaped.

The Russian Government is making strenuous efforts to turn the tide of emigration away from America to Eastern Siberia, particularly the Amur region. A German journalist who recently came west by the Siberian railway noticed every day from three to five emigrant trains making their way east, each train consisting of twenty cars—mere cattle-cars, the passengers being obliged to sit on their own bundles. The Government gives them passage for one-fourth of the price of a third-class ticket. Moreover, each family receives a present of 50 rubles, and the loan of 200 rubles more, to be repaid within ten years, while land for the colonists is free. It is usually chosen in places where agriculture can be supplemented by fishing. This is obviously meant to make head against the Japanese, who were accorded certain fishing rights by the treaty of Portsmouth, not only along the Siberian coast, but on the Amur and other rivers. At present the number of Japanese is not large, either in the country or in Vladivostok. That city, however, is overrun with Koreans and Chincse.

It is a trifle startling to read that France has tendered her good offices to help the United States and Japan in composing their differences. It seems, however, that the offer relates chiefly to an understanding with Japan about affairs in the Far East. This would make it a natural step consequent upon the recent agreement, on that subject, reached by France and Japan. Its terms have not yet been published, but the semi-official explanations have made it evident that the aim is for the two Powers to exchange satisfactory guarantees respecting their interests in the Orient. There would be involved, undoubtedly, the preservation of the existing *status*, and probably the maintenance of the open door in China. A similar agreement with Russia is also being striven for by the industrious Japanese diplomats. With its attainment, following the understanding with France and the treaty with England, the outlook for permanent peace in the East would be very good. Germany might not come into the group of agreeing Powers, but she surely would have no desire or motive to antagonize them. As for the United States, we cannot see that anything further could be expected from us. Alliances this country does not make, nor even a written *entente* with any one nation; and our policy in the Orient, as defined by Secretary Hay and maintained by Mr. Root, is wholly in favor of peaceful development. We want not a foot of Eastern territory; indeed, *sub rosa*, we should be mightily pleased to get rid of what we have. A fair field and no favors in trade is our principle abroad, whatever it may be at home.

A letter from Daniel Crosby Greene to the *North China Herald* gives details concerning education at the Japanese schools and universities. The liberality of the Japanese universities is shown at Tokio, where a course of lectures arranged by a Buddhist is given by a Roman Catholic, on the history of Christian doctrine. The spread of information among the humbler classes is very remarkable. Mr. Greene says: "While travelling in the mountains near Kioto, during Mr. Bryan's first candidature for the Presidency of the United States, I overheard my kago bearer talking about the probable effect upon Japan's finances if McKinley should succeed in defeating Bryan." Indeed, a career in diplomacy, the army, and in the learned world is open even to the common people of Japan. "In the nine years ending with 1904, out of fifty-three who successfully passed the examination for entrance to the diplomatic corps of Japan, three were nobles, nineteen were Samurai, and thirty-one were *heimin*" (common people). Fully one-half of the army officers are of the latter class; and out of twelve students who took their degrees at the Imperial University *summa cum laude*, three years ago, seven were *heimin*. Nor is the higher education of women neglected in Japan. She boasts of a "Women's University" with more than a thousand students.

THE PRESIDENT'S PROGRAMME.

Monday being one of Mr. Roosevelt's days of relaxation, with the lassitude of the summer vacation already upon him, he made only two long speeches and held but one naval review. We can imagine him saying, with Hotspur, "Fie upon this quiet life." Yet his countrymen cannot be quiet, or idle, if they are to gird up their loins for all the tasks he bids them rise and undertake. These latest addresses of the President's deepen the sense of wonder at the intricate and extended programme which he is laying out for himself. Ordinary statesmen are content to gain a painful inch at a time, but Mr. Roosevelt outlines legislation which would convulse the country and occupy Congress for years, yet does it with the easy confidence of a man who has only to speak and the thing is done. This whole attitude of his fairly challenges discussion of what his plans and hopes really are.

It is evident, to start with, that even he, in his most sanguine moments, cannot expect that any large part of his vast schemes will be carried out during his present term of office. Congress does not meet till December. Its "long session" will be almost certainly paralyzed by the timidity about radical legislation which prevails on the eve of a Presidential election. There will remain, for legislative purposes, only the crowded months of the short session, December, 1908—March, 1909. In the latter month, Mr. Roosevelt goes out of office, and what reasonable prospect is there that a tithe of the laws he wants passed will have been so much as debated by Congress? The answer is, none whatever; and nobody knows this better than President Roosevelt himself. All these projects of his are not for to-day, or to-morrow, but for the distant future. This stands out on the surface, and it is also what those deep in the President's confidence will tell you. He keeps on talking of sweeping changes in the laws, not as of work which he has any hope of accomplishing during his year and nine months in the White House, but as matter for *longs espoirs* of the future.

Does he, then, emit these views in the character of a prospective "sage"—a sort of farewell address to the American people? Hardly. We cannot conceive of Mr. Roosevelt meekly submitting to the reproach that there has been glorious fighting, and he was not in it. It is a distant programme he outlines, but it is unquestionably one which he expects to have a hand in shaping. His tone is not that of a man about to retire from the combat; or, if he retires temporarily, it will be only because he means to come back with renewed vigor. Thus his reiteration of ambitious plans for future legislation has a direct bearing on the plans which he entertains for himself. It may imply, as many think, that he intends to block out such arduous labors that the country will despair of getting any other man even to tackle them, and will insist upon his accepting a third term. Or it may indicate a shrewder and more far-sighted ambition. The President may have reflected deeply on the doctrine of chances and of "cycles"; may have convinced himself that a financial setback is certain to come next year, or the year after, and that he would be better off out of the Presidency than in. Then people would say: "The times were always good when Roosevelt was President, and there is nothing for it but to put him in the White House for eight years more."

Which destiny the President may have determined for himself and for the country, we do not profess to know. His friends declare that he is not so stupid as to prefer four years more of dubious success now, to eight years of assured power after 1912. In any event, it is to future contests that Mr. Roosevelt is plainly looking forward. For them he delivers the speeches which have no relation to present-day law-making. Believing that radical doctrines will grow in favor, he is content to startle his conservative party to-day, provided that the voters will be of his way of thinking a few years hence.

Mr. Bryan humorously protested the other day at Albany that he could advance no innovating views without having President Roosevelt presently utter the same opinion, with greater force and eloquence. He will feel like renewing his plaint when he reads the President's Monday speeches. Mr. Roosevelt quietly proposes to abolish the law of contributory negligence, in the case of accidents to workingmen. If Mr. Bryan had urged this—say, in 1896—it would have been called a shameless bid for the labor vote. But, coming from a Republican President, it is, of course, conservative, wise, and economically and legally sound.

These new proposals of the President, not being meant for immediate consumption, scarcely call for discussion now, in all their political and social bearings. Their interest by themselves is not so great as their interest for revealing the working of Mr. Roosevelt's mind and the trend of his ambition.

THE THIN-SKINNED CORPORATION.

"Cartoons and lampoons" are named among the weapons which commuters on the Reading Railroad used in their successful fight for the restoration of the old passenger rates which the company had raised in retaliation for two-cent fare legislation in Pennsylvania. If the embattled suburbanites had prevailed by means of threats that they would use the trolleys, or go and live on the lines of other roads, it would have been intelligible enough. The corporation might have figured out its probable immediate loss through a boycott, and its larger future loss, and then reversed its policy. We can understand how an artificial person could be reached through the pocketbook. But the cartoon is aimed specifically at the vanities and self-satisfactions of persons with feelings to be hurt and toes to be trodden on. The Reading Railroad is not supposed to have feelings or toes. How could satire or ridicule make any impression on it?

Theoretically, a cartoon of a corporation should have just about as much influence on its policies as a caricature of the moon would have on the tides. Like the virulent cartoons on the weather which have been turned out in such numbers lately, it should be regarded as a method of working off superfluous indignation rather than a contribution to any practical end. Yet the part which cartoons played in the agitation against one railroad's commutation rates is acknowledged. We have no doubt the same methods will now be applied to the Pennsylvania, which has announced a similar policy. The Reading is not the only road to feel the sting of the cartoon. Officials of one railway have confessed that nothing hurt them so much as certain parodies on the exploits of an immaculate young woman passenger, used in the advertising of a rival company and twisted into "roasts" on their own line.

The soullessness of the corporation has been axiomatic for generations, yet to-day it is remarkably sensitive. It may have no more moral responsibility or chance of going to heaven than a dog, yet it likes just as the dog does to be patted on the head, and shrinks from the harsh word. In practice, the entirely soulless corporation is "as mythological an entity"—to borrow a phrase from Professor James—as the "economic man" actuated only by enlightened self-interest. The accepted hynothesis has required every one who came in contact with corporations to make violent distinctions between them and their officials and employees. The Western anti-Trust agitator, for instance, had to admit that the Standard Oil was represented in the town by one of his most esteemed neighbors, while some of the best men he knew sold policies of Eastern insurance companies, whose very names would rouse him to fury.

How the human factor enters into the great as well as the petty affairs of the corporation is harder to realize. In an article in the current *Atlantic*, Mr. Hayes Robbins assembles some most interesting facts about "The Personal Factor in the Labor Problem." He dwells on the frequency with which devastating strikes have been averted by personal conference between the represen-

tatives of employers and employees, and points out how the point of contact between labor and capital has not been eliminated, but merely shifted, the immediate superior, foreman, superintendent, or gang boss representing to the subordinate much that the employer himself did in the days of the small business. One corporation shop may differ from another in atmosphere and methods just as much as one individual's shop did from another a generation ago. Nor is this the only notable example of the personal factor. Regulative commissions of railways or corporations, instead of finding that they have to deal with machines which only force can deflect from their chosen courses, record every year hundreds of instances of the sweet reasonableness which the industrial giants will exhibit when they are approached in the right way.

Souls or no souls, corporations do exhibit the qualities of plain human beings. Some are broad-minded, some pig-headed; some peppery, some complaisant; some hated, some relatively popular. Opper's beaming and rotund "Trusts" are as correct delineations as Davenport's microcephalic monsters with the same label. What Mr. Robbins says of the industrial corporation is not open to denial: "Its policies are made and carried out by *men*, and a man cannot divest himself of himself. If he tries to become an economic abstraction, he succeeds in becoming another and usually much poorer type of man, but still a man for a' that."

THE NEW ENGLISH LAND BILL.

In introducing the other day the Government bill to provide for small holdings of land, Lewis Harcourt made an allusion to that radical land-law reformer, Jesse Collings, now a Tory in good and regular standing. It was he who for years made the hustings echo with his cry: "Three acres and a cow!" Mr. Harcourt described himself as a humble pupil of Mr. Collings, dating back to the early days of the agitation for breaking up unimproved land into allotments—the days when, as the speaker wittily remarked, Mr. Collings "had the honor to be the bogey of the party bench which he now adorns."

Such jesting allusions to the way in which times change, and men and parties with them, do not, however, obscure the capital importance, both social and political, of the measure now before the Commons. Upon it the Ministry have staked their fortunes. It is the one outstanding law which they have marked for passage at this session of Parliament. It will undoubtedly pass the Commons, yet, as the Premier said the other day about the bills which he hoped to enact, "When I say 'pass,' I mean pass this House, for what will happen in the Lords, I am not able to predict." Yet if the bill should be thrown out by the House of Lords, that body would more than ever fall under the opprobrium of deserving to be known as the House of Landlords, and the party advantage of the Liberals would be almost as great as if the bill had been accepted by the upper chamber. So far, the Conservatives are standing about this land measure very much as, in Dr. Holmes's phrase, a set of pointer dogs would stand about a turtle. They do not know what to make of it, or what to do with it. They say that they agree with the principle of the bill, but are horrified by its details. This is probably the preliminary to a grudging acceptance of it, though Mr. Balfour has, as yet, given no sign. He and Lord Lansdowne have quite openly said that the Lords must not enter into a collision with the Commons except on "grounds favorable to themselves." For that reason they did not reject, though they roundly condemned, the bill to relieve labor unions from legal responsibility. It was a popular measure, and so they did not dare kill it. If the land bill proves as popular as it now promises to be, Balfour will give orders to his obedient peers not to kill that either.

Much of the credit for the initiative in this legislation is due to that active and rising politician, Winston Churchill. He first took up the issue with alert perception of its political significance, and has pressed it with energy and resource. In speeches at Manchester and elsewhere, as by letters and articles, he has shown himself his father's son in striking out for social reform and in assuming the leadership of a forward movement. From Churchill, the impetus passed to the Prime Minister, who also quickly saw the opportunity for recovering party prestige; so that now the bill is backed by the whole power of the Government, and bids fair to be the battle-horse of the remainder of the session of Parliament.

What are the conditions which call for remedial legislation, and what is proposed by the land bill? The grievance is manifold. There is, first, the steady depopulation of some parts of rural England. The land under cultivation is declining in area. Only one-third of the agricultural land in England is devoted to field-crops. In Denmark, the proportion is nearly two-thirds, and the difference may be ascribed, in part at least, to the small holdings of the Danes. Furthermore, the small farmer in England is at a disadvantage in point of fixity of tenure. There is also complaint of bad housing and unfair taxation. Land held simply to gratify the sporting tastes of its owner is assessed but a few shillings the acre, while farm lands, directly adjoining, pay six or eight times as much in taxes. Such an anomaly lends point to the contention that land should be valued, for assessment purposes, apart from the buildings or other improvements upon it. To this principle, Sir Henry Campbell-Bannerman has given his assent.

The bill itself makes but a modest beginning. It provides a way in which the local authorities and county councils may acquire, by either amicable purchase or expropriation, land suitable for small holdings. There are also to be two new Commissioners of Agriculture who, if the local authorities do not act, will have power to proceed in any county in England or Wales to take over land, at an agreed price or under compulsion, and to charge the price to the county councils. Property may also be leased, for small allotments, for a period of not less than fourteen years, with a privilege of renewal. Lands acquired in either way are to be let out in parcels of from five to fifty acres, not exceeding a rental value of $250 a year; and the rent charge is to be so fixed as to pay off the whole of the interest and sinking fund of the moneys expended in purchase or lease of land by the county councils. For the first year, the Treasury is to give the Board of Agriculture a credit of $500,000 for buying lands to be broken up into small holdings.

Whether any large practical results may be expected from this initial measure of land-law reform, opinions violently differ. Jesse Collings declared that the bill did not go nearly far enough, though his Tory colleague, Mr. Long, asserted that it went entirely too far. H. Rider Haggard, better known in another way, has made a minute study of the land question in England, and he stoutly denies that there is any such "land hunger" as Winston Churchill talks about. He, therefore, does not expect the drift to the cities to be checked by a provision for small holdings in the country. But the experiment is bound to be made; and its working out will be followed with deep interest by all students of the intricate social and political questions involved.

JAPANESE JINGOES—AND OTHERS.

"There is yellow journalism in Japan as well as in America." Such was the remark of a member of the Japanese Embassy at Washington, the other day. He might have added that Japan also knows what it is to have Jingoes. Many Americans express surprise at the Tokio dispatches reporting anti-American agitation, with appeals to the Government to uphold the national dignity, and so on: but all this ought to excite no special wonder among us. We are, or ought to be, perfectly familiar with the phenomenon. In all countries, in fact, which have government by party, the thing is well known. The party out of power is forever in tears and rage over the pusillanimity of the party in office,

when it comes to dealing firmly with foreign nations. If *we* were in charge of the government, no such patriotic humiliation would be undergone. This is an old story. It has been heard in the politics of England and the United States for a hundred years. Its appearance in Japan may thus be taken as a sign of her rapid political development. She is but adding a sensational press and frothing Jingoes to the equipment necessary for one of the progressive nations of the world.

The Progressives in Japan are merely doing what the Republicans in the United States were attempting in the years 1893 to 1896—that is, recklessly attacking the Government for its conduct of foreign affairs, in the hope of discrediting it and working their way into office. Who does not remember the lamentable groans over President Cleveland's course towards Hawaii? Suffering Republicans could not conceal their pain. It was so great that it could be assuaged by nothing but a prospect of officeholding. As this remained, like the prospect of Eton, rather distant, new fury had to be artificially excited over Venezuela and over Spain and Cuba. The heavens were rent by Republican cries about the contemptible weakness of the Cleveland Administration in "fronting" Great Britain. As for the disgrace of our attitude towards Spain, the feelings of our leading Republican statesmen almost choked their utterance—not quite, for they went about articulating brokenly: "Oh, the shame of it! Oh, for one hour of a Republican President, with all the rest of us drawing good salaries!" These noble tactics are being reproduced to the life by Count Okuma and his followers in the Progressive party and the sensational press of Japan.

This is not saying that there is no real friction between Japan and the United States, nor that the situation may not become serious. International clamors artfully and selfishly raised sometimes have evil consequences. They are certain to do so, if persisted in. An example is the present state of the relations of Germany and England. Such an amount of suspicion and inflammatory insinuation has found a place in the press of either country that the efforts made by public men and professors and the better class of journalists have succeeded in allaying only a part of the ill feeling. Our difficulty with Japan is somewhat similar. It is artificially created, but it may become real. Prejudice and partisan motives have been at work on both sides, hampering the efforts of responsible statesmen. The Japanese Ministry must be influenced by the outcry against them; nor does it lie in the mouth of the Administration at Washington to rebuke them for turning tail in the face of popular clamor.

Indeed, President Roosevelt's words about the Japanese question in his annual message, with his subsequent swallowing of them whole, have a good deal to do with the present troubles. This is semi-officially admitted in Washington, though in a perverse sense. We have just learned that the President's "official associates and closest friends" acknowledge that his handling of the Japanese matter last December was ill-judged; but this, because his language about Japan was "too fulsome," and created in that country the mistaken impression that our Government was "timid," and that Japan had only to assume a threatening attitude to force anything out of us she wanted. The facts, however, compel a different interpretation. What the President held out was a promise of generous and just dealing, which has not been fulfilled. This is precisely what the Jingo press of Japan is pointing out, and using with so much craft. It declares that President Roosevelt pledged himself to fair and honorable treatment of the Japanese in this country, even urging their admission to citizenship, but that since then nothing has been done except to demand absolute exclusion of Japanese laborers. Consequently, the Japanese "outs" are asking what sort of Government they have, if it is so weak as not to hold the ruler of the United States to his word. The Japanese may be able to answer the question, but it certainly has its awkwardness for Americans.

We do not regard the tension with Japan as alarming, but it surely should be sobering. We see our own methods turned against us. As the philosophic Mr. Dooley pointed out last Sunday, we have immemorially gone on the assumption that the foreigner existed only to be ridiculed and insulted by us. "That's what they were f'r." But now we have found out, to our disgust, that they have as much sensitiveness and pride as we have, and that they resent our brutality. "Why, be hivens, it won't be long till we'll have to be threatin' th' Chinese dacint!" The prospect is enough to make Mr. Dooley sigh for the good old days "befure we become a wurruld power."

FRENCH VIEWS OF RELIGION.

The secularizing movement in France has been accompanied, rather strangely, by a revival of interest in the philosophy of religion. Its beginnings are marked, approximately, by the publication of Guyau's "Irréligion de l'Avenir"; its latest development is a series of essays by Prof. Marcel Hébert, entitled "Le Divin." The anti-clerical party may not be anti-religious, but it cannot be denied that anti-clericalism derives its impetus and effectiveness from an anti-religious undercurrent. As usually happens when the ties are relaxed which have bound men to the church and the historic faith, there has arisen a spirit of free inquiry. In England, when faith in religion is weakened, interest in moral theory is deepened; and the same is true of Germany. But in Catholic nations like France, ethics and some form of religion are held to be inseparable; and negation, as well as reliance on ecclesiastical authority, is apt to give way to a religious philosophy which may be loosely defined as mysticism.

Earlier periods of thought furnish parallels to what may now be witnessed in France. When the Greek schools were disintegrating, and polytheism was disappearing, Neo-Platonic mysticism arose. Mystical philosophy, both within and without the church, succeeded the formal philosophy of the later schoolmen. Agnosticism in England, and rationalism in Germany, produced new activity in ethical theory and ethical culture. And the long array of recent publications in France proves the truth of M. Pillon's saying that, in that country, "Mysticism is *à la mode*."

M. Hébert's book abandons the old method in religious philosophy. Its starting point is a psychological fact, not a metaphysical theory. The natural theologian used to demonstrate, to his own satisfaction at any rate, the being of God and the immortality of the soul; and it was supposed that the religious feeling was provoked by the knowledge of religious truth. But in the religious philosophy of the hour, the psychological question is paramount —What is the religious feeling? With M. Hébert, as with Professor James in his "Varieties of Religious Experience," this feeling has its roots in the subconscious region. When its comes up into consciousness, it is like a vine which attaches itself to proximate objects. On the lowest level, it is concerned with the totem or fetich; on a higher scale it rises to an ethnic deity, or a Creator, personal and omnipotent, or conceives of Nature as the sum total of all existence. But the modern mystic, perplexed by the insoluble problems concerning the divine goodness and finite evil, the divine power and human liberty, rests in the contemplation of infinity, goodness, love, considered as abstractions. Perfection becomes the object of the mystic's contemplation. "It is not," says M. Hébert, "the simple sentiment of the perfect" which is characteristic of the mystic's consciousness; "It is the *obsession* of the perfect; but the obsession bears witness to the existence of the sentiment."

To reduce such a doctrine to a scientific formula is impossible. In proportion as science advances, mysticism recedes, but it has always the unknown, the indefinitely perfect, as the object of contemplation and the source of inspiration. It is easy to see how readily

such a view of the religious consciousness may accompany a belief in the doctrine of Comte or of Herbert Spencer. Comte, in spite of his Positivism, was really a mystic. Humanity was his name for the perfect abstraction. Advancing science can never detract from the Unknowable, which is the agnostic's deity. If it be asked how this religious feeling is manifested in experience, M. Hébert seeks to show that the contemplation of abstract perfection is not inconsistent with the pursuit of what approaches perfection in the concrete. A relation can be established between the ideally best and that which is best in our experience. The idea of the perfect takes hold upon the real, adapts itself to it, penetrates it. Thus the life of the mystic is active as well as contemplative.

This view of religion, as M. Hébert admits, lies beyond the region of demonstration. It is justified, however, he thinks, by its intrinsic excellence and by its effect on human action. Thus the mystic view of the world becomes one with the "pragmatic." If it be accepted, there can be no religious sects united by a common creed or set of dogmas. There may be a variety of free religious associations, but in them theory will be nothing, practice everything, and the goal of all will be the same. The forms of religion will be as various as the forms of art; for men's ideas of perfection will differ just as will their ideas of beauty, according to time, place, and education. For the last two decades, mysticism of this general description has been set forth with various modifications by more than a score of the most fluent philosophical writers in France and Belgium. In no other countries has the tendency been so prevalent. Its attitude toward the church has usually been irenical and tolerant. But while it may attract a certain thoughtful and sentimental élite, it is not likely, in this rough world, to be potent as an agency for moral reformation.

RECENT NOVELS BY GERMAN WOMEN

There has been a great change in the fiction written by German women. In the period when the gilt-edged album for younger or older daughters flourished on the holiday market, the pages of the magazines were flooded with mildly innocuous stories of anæmic heroines, who fainted in proof of their womanliness, drifted into consumption when their heart was broken by unrequited love, or found him who, in the words of the song by Schumann, was "der Herrlichste von Allen," and lived happily ever after. But no sooner had the Scandinavian wizard given German women a glimpse of his "Doll's House," than the progeny of unfortunate little Nora appeared in German fiction, and, reinforced by the *Tendenz* of "The Heavenly Twins" and "Discords" and "Keynotes," produced a variety of complicated characters entangled in difficult situations.

The disposition of the fiction produced by German women to-day is as widely different from the stories which even twenty-five years ago delighted the *Lesekränzchen* throughout the empire and drifted to America through Mrs. Wister's translations, as from the books which were thrown upon the market by the publishers of an advanced woman's magazine a few years ago and stirred up heated controversy in the German press. There is nothing narrowly bourgeois about it, as Gertrude Atherton uses that word, nor is it burdened with a revolutionary message. It may touch upon problems of modern life or throw the light of modern reading of life upon past periods of history, but it is primarily conceived with an artistic, not an ethical, purpose.

Ricarda Huch, who, by her critical study of German romanticism, her lyrics, and her novels, has been unanimously accorded a place among the best contemporaneous writers of Germany, regardless of sex, stands aloof from the *Tendenzliteratur* of the time with aristocratic reserve. Her stories have always dealt with people whose inheritance has bound them to the traditions and conventions of the past, and even when her scions of old patrician families trespassed against the code of conduct laid down by their fathers' fathers, there was nothing in her treatment of the resulting conflict to indicate a critical attitude toward society. This objective view entirely dominates her latest work, the first of a trilogy of novels of the era of Garibaldi. While in her former books the warm and animated style established a certain intimacy between author and reader, there is no such personal appeal in "Die Verteidigung Roms" (Deutsche Verlagsanstalt, Stuttgart). The style is dry and cold, and suggests a purely historical record, rather than a sympathetic and artistic reconstruction of a page of history.

Those critics notwithstanding, who would limit her power to one class of stories, and the scene thereof to one little spot on German soil, the work of Clara Viebig is remarkable for a uniform excellence which commands respect. Whether she describes village life in the Eifel range or the Rhenish gayety of Old Düsseldorf; the sordid, common-place tragedy of a servant girl in Berlin, or the vicissitudes of the German *Gutsbesitzer* in the province of Posen, where the atmosphere is charged with racial and religious antagonisms, Frau Viebig always tells her story directly and and effectively, her construction is admirable, and her characters are almost without exception alive. Even when she treats unpleasant problems, she does not lose her hold on the sympathy of her readers, because her vision is normal and her tone wholesome. One of her recent novels, "Einer Mutter Sohn," tells the story of a childless woman adopting and transplanting into her refined Berlin home the baby boy of poor peasants. There are three powerful dramatic moments in this book: the first is the parting of the mother from her child, when, after having received the sum for which she relinquished all her parental claims, the maternal instinct wells up in a wave of savage passion and culminates in an act of violence. The second is the scene when the boy, whose racial instinct resents the careful home-breeding and school training which are to prepare him for cultured society, learns his descent and confronts his foster-parents with the brusque question: "Where is my mother?" Then there is that final chapter, when the youth, whose peasant vitality, instead of finding a natural outlet in a life in the open, has been exhausted in the pursuit of metropolitan pleasures, forces upon the woman who has given him the unspent maternal affection of a whole life, the painful knowledge that she has made an irreparable mistake. From the psychological standpoint, this book is Frau Viebig's greatest achievement.

Although widely different in theme, her latest novel, "Absolvo Te" (like all her works published by Egon Fleischel & Co. of Berlin), also bears upon the question of unwarrantable interference. The handsome and refined daughter of a schoolmaster, who from cultured Germany has drifted into a rural community in Posen, is, when a mere child, forced by her widowed mother into marrying a wealthy old farmer. In her adolescence she had dreamed of a celestial bridegroom, and she never forgives her mother for brutally arousing her from that dream to a repulsive reality. The mother dies after a brief enjoyment of their material prosperity, but the daughter cannot overcome her disgust of the husband forced upon her. Even the little girl to whom she gives birth does not soften her heart. The attentions bestowed upon her by the masculine population of the small community turn her head. While in her daughter the semi-religious idiosyncrasies of her own youth reappear and develop into hysteria, the mother eventually becomes the prey of a criminal desire to precipitate the old man's death. The sordid story is only occasionally relieved by touches of grim humor.

It seems a pity that Frieda von Bülow, who, some years ago, started the colonial fiction of Germany, should have abandoned a field in which she had no competitors. "Tropenkoller," the title of her first book, was a word coined by her for the change wrought in men, who, from a spirit of adventure or business enterprise, had migrated to Africa, and had developed an unscrupulous, brutal bravado, which, in that climate, seems to take hold of the cool-headed North-Germans with the power of a madness. The story started the ball rolling, but none of her successors presented the problems of German colonial life in the tropics with the same vitality. Orla Holm's "Pionere" (F. Fontane & Co., Berlin) is but a faint attempt in the same direction. The book makes little call upon the imagination. It reads like an unpretentious translation of a page from real life, the sole charm whereof is its simple pathos. Since Gustav Frensseu has picked up the thread which Frieda von Bülow dropped, and in "Peter Moors Fahrt nach Südwest" has told the story of German colonial Africa from the standpoint of the soldier, it will be difficult for any new author to treat that subject.

A writer of distinct individuality is Frau Helene Pollidahl, who, under the pseudonym of Hermann Dahl, is producing intensely interesting studies of temperament. In her first book, "Der Göttliche," she limned the

religious type; in her last, "Harald Atterdal," the artistic. The scene of both is Scandinavia, the atmosphere of which seems to lend itself to the high emotional pitch maintained throughout this account of her hero's relations with women. The character of Harald is an unflattered portrayal of a type of decadent peculiar to our time. The author herself indulges too much in that very analysis of the feelings which proves destructive to genuine sentiment. The women, especially, seem unreal in the complexity of their emotions, and only the mother of the hero stands forth as a living type of simple devotion and loving faith. The story is written in the nervous style which has grown to be the regular vehicle for the psychological problem novel of the modern Germans.

A life of humble toil and hopeless poverty is pictured in the book of a powerful new writer, Charlotte Knöckel. The scene of her "Kinder der Gasse" (S. Fischer, Berlin) is a manufacturing town, and the plot deals with the sordid features of tenement and factory life in their bearing upon the development of children. The progress which German fiction has made within the last ten years is best seen in a comparison of this book with the slum stories of the nineties. The author is more concerned with the inner life of her people than with their struggle for bare existence, and presents her ease in a simple, direct, and forceful style, as remote from maudlin melodrama as from partisan proselytism.

Countess Uxkull is one of the writers who have outgrown the period when they used the novel as vehicle for ideas on social reforms. She has left the world of to-day with all its vital questions for a world of her own poetical creation. Her volume of short stories, "Ins Leben zurück" (F. Fontane & Co., Berlin), is full of mature philosophy, and has the perspective of the true artist. In "Euphorion" she presents the old struggle between the Hellenic and the Christian ideal of life in a tale of almost classical beauty. In "Jenseits der Mauern" she treats the problem of self-conquest in a picturesque Renaissance setting. There is a strong dramatic element in the three stories which are told in language of rare beauty and finish.

Lulu von Strauss-Torney has gone back to the past in her two latest books, the short stories "Der Hof am Brink" and "Das Meerminnecke," and her novel, "Lucifer" (Egon Fleischel & Co., Berlin). A German village in the Thirty Years' War is the scene of the first story; German peasants and Swedish soldiers are the actors. "Das Meerminnecke" is laid in a town of Holland during the first tumultuous struggles between the old and the new faith. Pale-faeed, black-eyed, and red-haired—a combination of colors which is in itself an offence against the proprieties of a mediæval village—the pitiable survivor of a Spanish wreck makes her entrance in a hamper carried by two stout fishmongers. She has barely escaped the persecution of her race at home to be hounded by the superstition of a Dutch mob. Yet the pathos of this story is not unrelieved by humor, and some of the scenes are delightful, especially those in the convent whither the chaplain has hurried the unfortunate stranger. "Lucifer" is a more ambitious attempt at historieal fiction, and deals also with religious struggles, the hero having been forced by his mother to take holy orders and even during his novitiate trespassing against his vows and harassing the pious fathers by his doubts. The consistency with which the author evolves this character is admirable.

A. von Ende.

NEWS FOR BIBLIOPHILES.

The Anderson Auction Company has sales five days next week. That of June 17 and 18 includes Lieut. James Moody's "Narrative of his Exertions and Sufferings in the Cause of Government since the year 1776," 1783, a very scarce book by a New Jersey Tory; various first editions of Thackeray, Thoreau, Tennyson, and others; Dinsmoor's "Incidental Poems," 1828, in the origiual boards, uncut, and having laid in an unpublished manuscript poem; Tyler's "Contrast," 1790, having the frontispiece by Maverick, but lacking one leaf at the end: several of Valentine's Manuals; some good autographs, including a three-page A. L. S. from Gladstone, in which he says: "My favorite axe is an American, with an American handle, split half-way down and secured by being tightly bound with wax string. This singular condition gives it a remarkable elasticity, but if the string were removed the handle would go to splinters at the first stroke."

Part seven of the Kopetschney collection will be sold June 19 and 20 by the Merwin-Clayton Sales Company. Works on Art, Bibliography, Biography, History, Dramatic Literature, Natural History, etc., together with numerous French, Italian, and German books, make up this portion.

On July 1, Sotheby, Wilkinson & Hodge will sell the small but very choice collection of Stuart M. Samuel, M. P. There are 199 lots only in the catalogue, but among them are some choice "association" items. Mr. Samuel has, perhaps, been best known as the owner of the Crampon copy of Browning's "Pauline," which has an interesting inscription on the fly-leaf, and which sold for £145 in the Crampon sale in June, 1896. A set of "Bells and Pomegranates," eight parts, presentation copies to W. J. Fox, one of Browning's earliest friends to recognize his genius, as well as proof-sheets of several numbers of the same, are equally interesting. There are presentation copies of first editions of Browning's books, including "Christmas-Eve and Easter-Day," "Balaustion's Adventure," "Fifine at the Fair," "Red Cotton Night Cap Country," "The Inn Album," and others. The Byron items are few, but important. "English Bards and Scotch Reviewers" has a portion of the original manuscript inserted. "Manfred" was Byron's own copy, with an unpublished soliloquy, three pages, in the author's autograph. "Alice's Adventures in Wonderland" is the genuine first edition, dated 1865 (the second edition, 1866, is usually described as the first), and has five of the original drawings by John Tenniel, and several proofs of the engravings inserted. "Through the Looking-Glass" also contains five of Tenniel's original drawings. The series of presentation copies of Dickens is the most remarkable offered since the Wright sale in 1899, in fact, some of these were Wright's copies. There are several of Coleridge's books, with manuscript additions and alterations; also presentation copies of "Remorse" and "Aids to Reflection." There are presentation copies of Gibbon's "Roman Empire," first editions, 1776-88; Longfellow's "Evangeline," 1845; Richardson's "Clarissa," 1748; Tennyson's "Enoch Arden," 1864, and "The Window," 1867, and Thackeray's "Virginians," 1858. The last-named, given to Peter Rackham, contains this inscription in Thackeray's autograph.

In the U. States and in the Queens dominions
All people have a right to their opinions
And many don't much relish The Virginians.
Peruse my book, dear R., and if you find it
A little to your taste I hope you'll bind it.

Rackham, however, seems not to have found it to his taste, as it is still in the original cloth.

The death, on May 16, of Edward Grose Hodge, for many years the head of the great English book-auction house, has been noted in the English papers. He was in his eighty-second year, and the active management of the business had been for some years in the hands of his son, Thomas Hodge. There has been, we believe, no Sotheby or Wilkinson in the firm for many years.

Correspondence.

REJECTION OF THE IRISH BILL.

To the Editor of The Nation:

Sir: Letters from Irish and English members of Parliament, and from several acute observers in Dublin, added to my own experiences of many years, have placed me in possession of a complete narrative of the reasons and manœuvres resulting in that summary rejection of the Administration Reform bill for Ireland, which has astonished people unacquainted with the dishonesty of Irish parliamentarian life under present conditions.

There are two fundamental facts of the Irish situation. These are the clerical monopoly in general and the parliamentarian monopoly of political representation. By the former I mean the privileged position which the Church owes to its century-old arrangement with the British Government, and which assures it, in return for political and police services, its situation of exceptional ease and emolument under the British power. By the second is to be understood the absolute and jealous domination of the parliamentarian machine, which is also a clerical machine, in everything relating to election and representation among the present population of Ireland. From the first nomination of candidates in the local sacristies to the publication of their parliamentary eloquence in the *Freeman's Journal*, there is no stage in the selection or action of an Irish member of Parliament which is not jealously supervised with a view to rendering impossible the growth of any opposition to the parliamentary monopoly.

With these preliminary explanations, let us come at once to Sir Antony MacDonnell, the *fons et origo mali*, the Anglo-Indian under-secretary of pronounced Nationalist convictions, who won especial reputation as a great administrator in India, and

who, hearing the persistent abuse of "Nominee Castle Boards" from all classes of "Patriots," appears to have believed that Mr. Redmond and the bishops would really like to see a system of representative laymen in place of the wire-pulled institutions in evidence. Instead of a bishop tripping deftly up the Castle backstair to recommend his favorite to the vice-regal government, he should have to address his requests to a popularly elected Council of Irishmen; and, as I have said, the confinding Sir Antony may have imagined that the bishop would like the change. He now knows better.

The beginning of the story opens, accordingly, with Sir Antony MacDonnell's careful preparation of a bill which, while leaving absolutely unchanged the existing powers of the viceroy and the parliamentary party, substituted for the Castle nominees on the eight principal boards of Irish administration, a single council of popular representatives, who, with all the powers of the existing boards, should control the administration of some twenty-five million dollars annually of Irish expenditure. Any misuse of the Government power of supervision could always be met by the undiminished influence of the Irish party in Parliament, exactly as in the past. But the party, far from desiring to protect a rival "talking shop," preferred to destroy it from the first. Thenceforth, the stages of the affair were the following:

(1.) The parliamentarian leaders were vastly embarrassed at the friendly "consultations" with which Sir Antony MacDonnell and Mr. Birrell overwhelmed them, being afraid both to say how much they disliked any increase of popular representation in Ireland, and how much their own existence was bound up with the maintenance of the existing monopoly.

(2.) The bishops and priests, in open panic at the threatened intrusion of lay inspection into their educational and other preserves, resolved at all costs to break the bill, and pretended to suspect that the parliamentarians were willing accomplices in a black work of anti-clericalism.

(3.) Both bishops and parliamentarians instinctively recognized that it would be highly unsafe to avow that popular representative administration was the bugbear; and, "patriotic indignation at bill not being home rule," was officially declared to be the policy of the alarmed confederates.

(4.) These clerico-parliamentary manœuvres were immensely aided by the Healy-O'Brien vendetta against Messrs. Redmond and Dillon, and by the ultra-patriotic hostility to all parliamentarianism whatever. Both these elements combined to denounce the bill as "not home rule," which of course, it never pretended to be, and to denounce the parliamentary party as "vile traitors for promoting it," which, of course, they never had done.

(5.) The ground being thus smoothed by all the outside parties uniting to denounce the "anti-home rule insult to Ireland," etc., the game of the parliamentarians became beautifully easy. Adroitly slipping into the skin of the most ultra-patriots of all, the convention flung out the bill without discussion—which might have been inconvenient—and thereby rescued the parliamentary monopoly of representation and the clerical monopoly of education from the dangerous reform amid the most exhilarating shouts of "God bless Ireland, our patriotic members, and our noble clergy!"

(6.) As only the advanced Liberals, influenced by Sir Antony MacDonnell and Mr. Birrell, ever cared to understand that the clerico-parliamentary Trust was directly at stake, Mr. Redmond had no difficulty in convincing the Liberal Cabinet that unrepresentative Castle boards are very much better as they stand, and that the parliamentary party fully deserves the continued confidence of his Majesty's Government. To show this confidence, and to bind more closely the Irish farmers to the parliamentary party, the Government has just promised Mr. Redmond a bill for the compulsory restoration of evicted tenants.

Undoubtedly, the note of gayety in this drama of tragi-comic politics is given by the ultra-patriots, who rushed with levelled horns, and bellowing furiously, against the bill in the fond belief that they were opposing the parliamentarians! Home rule is now indefinitely side-tracked, to the boundless joy of the Trust, and the parliamentarian party will proceed to hunt the House of Lords, or any other irrelevant quarry indicated to them by their Liberal leaders. So much for the farce at Westminster. In Ireland, the Trust will also reap the reward of its dexterity in suppressing popular representation, and the unhappy land will continue to be the premier country of clerical graft under the century-old concordat between London and the Vatican.

F. Hugh O'Donnell.

New York, June 6.

MASOLINO.

To the Editor of The Nation:

Sir: If Philip J. Gentner's theory of the chronology of Masolino, published in the *Nation* of May 2, be correct, it will help to clear up a very difficult and obscure problem. For on the accepted chronology it was too easy to argue that Masaccio must have participated largely in the frescoes in S. Clemente at Rome. They could not be entirely by Masolino, as Richter and Berenson (not to mention any earlier authorities) assert, because Masolino could not have so retrogressed from their standard of art. But a master may rise to a level from which a subsequent decline of the same degree is, to quote Mr. Gentner, "impossible." The argument, therefore, for the appearance of Masaccio in work adjudged by experts of unquestioned authority to Masolino—for Cavalcaselle's general position on the question of the relationship of the two artists as against Richter and Berenson—can no longer rest upon a negative plea, upon a reduction to stylistic absurdity, it must adduce positive evidence.

Leaving aside the traditional view, which might throw the *onus probandi* on the other side in this case, whereas in the case of the works in the Carmine at Florence tradition points the other way, we now have the advantage, as I consider it, of discussing the question upon its merits; we are confronted with a problem which depends for its solution upon sheer criticism.

If we admit Masolino at all as working in the S. Clemente series I think that Mr. Gentner's theory is possible. That we must admit this, *pace* Cavalcaselle, seems to me to follow from the general impress of Masolino's style which Masaccio, were he working alone, would hardly continue without greater modification than is exhibited in some of the pictures—in which the modification is present to me, but is manifest in the working out rather than in the compositional scheme. In other words, the customary practice of admitting to the execution of a large design the gifted scholar seems to explain the stylistic characters best. In the Annunciation, for instance, there may be little or nothing of Masaccio. Towards the end of the series, however, as in the Martyrdom of St. Catherine, or the scene where the saint is disputing with the Heathen Doctors, I see the unmistakable power of a bolder, keener draughtsman, inspired by classical art to interpret in the heads a typical dignity and a severe character alien to Masolino, and approaching Arnolfo. Masolino imports from Rome to North Italy (on the accepted chronology) accessory and decorative motives. Masaccio goes straight to the heart of his figurative models and limns their inner being as sheerly as a Hogarth or a Daumier.

A comparison between the Martyrdom and the Herodias scenes at Castiglione d'Olona exhibits an obvious external relationship in the general compositional types between the two artists, but in the special point of landscape we may note that the foreground of the Martyrdom, in its scientific observation might be by Bonnat, in its broad sweep and ideal arrangement might be by Harpignies. No Italian artist, except Masaccio, paints landscape in this fashion. Masolino does not, although he approaches Masaccio. That he could match Masaccio in this respect is possible, but it is very unlikely. We conclude, therefore, considering, of course, other stylistic evidence which is of the same sort, but which I have not space here to develop, that within a Masolino series of compositions a still subordinate yet characteristic phase of Masaccio's art is discernible. This is not to say that it is the earliest phase of the younger and greater master, or that Cavalcaselle and tradition may not be right in giving the whole series to him. It is quite possible that among the panel pictures, some of Masaccio's still earlier art may be found—or that the two artists may be together involved. To me the Madonna in the lap of St. Anne, in the Academy at Florence, is rather a Massacio than a Masolino.

When it comes to the Carmine at Florence, where the genius of the younger master is mature and emphatic, I must be content to register the mere personal opinion that Cavalcaselle is nearer the truth than Richter and Berenson—that, for instance, between such a masterpiece as the Healing of Tabitha and anything conceivably Masolino's yawns the gulf which divides a compelling art from the merely winning. And I cannot *see* any stylistic difference between the Adam and Eve and the Expulsion. The only material evidence must be technical; and no exhaustive treatment of the problem from the technical point of view is yet available.

I may say also that in these problems the adumbration of the school is often elucl-

datory of essential differences in the masters. One observes in Masolino certain exoticisms—like those of Giovanni da Milano in the tre-cento—which I think are reflected in some types of the industrial painting of the succeeding generation. This may perhaps be seen in the Visit of the Queen of Sheba to Solomon, at New Haven. One may distinguish in these exuberant and descriptive panels at times on the one hand the restraining influence of Masaccio, and on the other hand a more eclectic and romantic class of decorative pictures which may well have one source of inspiration in Masolino. Mr. Gentner has promised us to investigate Masolino's extra-Florentine features. It will be a welcome contribution to the study of this all-important period of art. WILLIAM RANKIN.

Richmond, Mass., June 7.

COLLEGE TYRANNY.

TO THE EDITOR OF THE NATION:

SIR: The letter of Professor Dodd in No. 2182 of the *Nation* leads me to speak of another phase of our higher education that is quite as detrimental to the freedom of teaching and even to liberty of action on the part of college faculties as any to which he calls attention. I refer to the tyranny of presidents. I have reason to believe that the heads of quite too many institutions not only determine its general policy, but also interfere in the work of the departments. If a member of the faculty has the courage to protest against such an unwise and unwarranted assumption of power, woe be to him! Under such a régime it is not worth while to discuss in faculty meeting any measure in which the president is interested; it is merely necessary to get his opinion or to ascertain his wishes, and the matter is settled. It seems to be the case generally that a member of the faculty or even the faculty as a whole has no access to the board of trustees except through the president. He will naturally see to it that they find out only such facts as he does not deem prejudicial to his personal interests. At best, the governing body is likely to hear only the president's interpretation of any communications that may come to them directly or indirectly.

It is reasonable to assume that a body of instructors, let us not say of forty or fifty, but of ten or twelve persons, is in most cases more competent to decide questions of educational policy than the man selected as the head often is. If faculties had a larger voice in choosing who should rule over them, the lot would not so often fall upon the bramble. An instance recently came under my observation where several members of a college faculty were summarily discharged by the president without a reason given or without an opportunity of saying a word in their own behalf. If the testimony of their students is of any value, most of these men were not incompetent—a condition of things the president must have known or could easily have ascertained if he cared to take the trouble. Their crime seems to have been that they were not "loyal." The professor in a denominational institution who attacks the fundamental principles on which it is founded and for the maintenance of which it receives support, should not complain if he is dismissed; but dismissal is usually for quite other reasons. A gentleman was recently in my office who, in the course of our conversation, mentioned an instance where the president of a college not only discharged a member of his faculty without warning, but had rubbed salt into the wound by telling him, the victim, that if he applied for another place he would himself see that he did not get it.

It is altogether probable that the low estate to which honorary degrees have fallen in this country is due to the heads of institutions that have authority to confer them. Notwithstanding the fact that a man whose influence can be got with an honorary degree is not worth considering, the miserable business goes on apace. I venture the assertion that if college faculties had a free and fair vote on the matter, the number would be diminished by two-thirds. As neither the recipient of such a degree nor the giver is benefited, since the whole business has come to be regarded as a farce, it is a wonder, as it is certainly a pity, that these performances do not come to an end. The cause of higher education is belittled, if not besmirched. It is, too, a serious misfortune that our educational standard is too often made by numbers rather than quality. Dr. Arnold's preference of fifty choice young men to six times this number made up of the go-as-you-please class finds little favor in most places. If, then, by hook or crook a president succeeds in getting together a large number of students at the institution over which he presides, he is hailed by his friends as a "decided success," as a "great educator," and so forth. Often the truth is that this very fact indicates a decline rather than a growth. Even the number of graduates sent forth by an institution is not a criterion of its value as an educational force. Those who have sufficient discernment to detect the true condition of affairs and the courage to reveal it are cried down as "kickers" and "croakers," for is not an abundance of tangible evidence at hand to condemn them? It is a curious anomaly that while the tendency of the times is in the direction of a broader democracy, it has not made itself felt to any appreciable extent in our higher education. CHAS. W. SUPER.

Athens, O., June 7.

Notes.

Arthur W. à Beckett, who has been master of the revels of Gray's Inn since 1887, is preparing a work on the duties of that office which goes back to Plantagenet times.

The Library of Congress issues three useful Select Lists of Books at the price of ten cents each: "On Reciprocity with Canada," "Relating to Iron and Steel in Commerce," and "Relating to the French Alliance in the American Revolution."

The second volume of "Henslow's Diary," edited by W. W. Greg, is now in the press. But before its appearance Mr. Bullen will publish for the same editor the "Henslow Papers," containing reprints of documents, chiefly preserved at Dulwich, which form a valuable supplement to the "Diary," and add considerably to our knowledge of the Elizabethan stage.

Six new volumes of the World's Classics, published by Henry Frowde, contain "The Works of Burke" (vol. iv.), "Palgrave's Golden Treasury, with Additional Poems," "Carlyle's French Revolution" (2 vols.), "Hazlitt's English Comic Writers," and "The Poetical Works of Goldsmith." A good deal might be said of the Introductions and Notes to some of these volumes. Thus the Goldsmith, edited by Austin Dobson, is a reprint of the Clarendon Press edition of 1887, but extended so as to include the whole of Goldsmith's poetry, and revised so as to bring into the annotations the latest information about the poet.

In a fifth volume, Prof. John Burnet completes his edition of Plato's Works in the Scriptorum Classicorum Bibliotheca Oxoniensis—a notable undertaking. The "Spuria" are added at the end of this volume, although it was the editor's original intention to print them separately in a sixth volume. We cannot here criticise the constitution of the text, but we may take the occasion once more to commend the beautiful typography of these convenient books.

Houghton, Mifflin & Co. have postponed the publication of the following books until autumn: "The Literature of Roguery," by Prof. F. W. Chandler; "The Life and Times of Stephen Higginson," by T. W. Higginson; "The Art of Landscape Gardening," by Humphry Repton; "A Theory of Motives, Ideals, and Values in Education," by William E. Chancellor; "What Method of Education Is Best Suited for Men Entering Upon Trade and Commerce?" by H. S. Person; "Federal Regulation of Railway Rates," by A. N. Merritt; and "Should Ship Subsidies Be Offered by the Government of the United States?" by W. T. Dunmore.

"Il Sacro Romano Impero," a translation of Bryce's "Holy Roman Empire," by Ugo Balzani, comes to us in a second revised edition from the house of Ulrico Hoepli of Milan.

Among the French books just published, or soon to be published, are the following: "Venise au XVIIIe siècle," by Philippe Monnier; "Genséric, la conquête vandale en Afrique et la destruction de l'Empire d'Occident," by F. Martroye, and "L'Allemagne moderne, son évolution," by Professor Lichtenberger of the Sorbonne. A work of great interest is Dr. Paul Triaire's first volume of the "Lettres de Guy Patin, 1630-1672." Dr. Triaire reprints the letters from the MS., correcting many errors and filling out many omissions of the earlier editions. He adds more than 1,600 notes.

The French Académie des Inscriptions et Belles-Lettres has awarded two prizes of 2,000 and 1,200 francs respectively. The first went to M. Poupardin for a work on "Le Royaume de Bourgogne"; the second was divided, going to Alfred Grenier for "Les Habitations gauloises et villas latines dans le pays des Médiomatrices" and to *La revue du Pays Messin et de la Lorraine.*

At the fifteenth annual meeting of the American Jewish Historical Society, to be held at Newport July 4 and 5, the following papers will be read: Dr. Cyrus Adler, "An Original Unpublished Document relating to Thomas Tremino de Sobremonte (1638),"

and "A Contemporary Memorial relating to Damages to Spanish Interests in America done by Jews of Holland (1634)"; Edmund H. Abrahams, "A Few Facts Relative to the Sheftall Family of Georgia"; J. Cassuto, jr., and Dr. Max Grünwald, "An Unpuhlished Transcript from the Records of the Portuguese Synagogue of Hamhurg regarding a Jewish Colony at Serepique (Sergipe, Brazil?) (1658)"; Hon. N. Darnell Davis and J. Graham Cruickshank, "Notes on Early Jews in the West Indies, particularly in Barhados"; Alhert M. Friedenherg, "The Influence of the German Revolutionary Movements of 1848-1849 on the Jews of America"; Dr. Herhert Friedenwald, "Sectarianism in the State Constitutions of the United States"; Rev. P. A. Hilfman, "Some Notes on the History of the Jews of Surinam"; Hon. David E. Heineman, "Notes on Early Jewish Wayfarers in the Northwest"; Prof. J. H. Hollander, "A Note on Jewish Influences in Longfellow's Verse"; Leon Hühner, "Some Additional Notes on the History of the Jews of Georgia in Colonial Times," "Aaron Lopez, a Merchant Prince of Colonial Rhode Island," and "Some Jewish Associates of John Brown"; Prof. Joseph Jacobs, "The Mediæval Status of the Jew"; Max J. Kohler, "Notes on the History of the Jews in Jamaica," and "The Proposed Extension of the Scope of the Society to embrace General Jewish History"; Samuel Oppenheim, "The First Settlement of the Jews at Newport"; Rosalie S. Phillips, "A Burial Place for the Jewish Nation Forever"; Rev. B. H. Rosengard, "The Historic Consciousness of our Race."

The following facts are gathered from the annual report of the curators of the Bodleian Lihrary for the year 1906: There was added to the library during the year a total of 77,637 items, including volumes and parts of volumes, making the second largest total in the history of the lihrary. Of these, 53,163 were received under the copyright law, 13,465 hy gift and exchange, and 11,009 hy purchase. From the tahle of purchases, donations, and exchanges arranged hy country, it appears that additions were made as follows: From Germany, 5,948 items; from France, 3,761; from Great Britain, 3,431; from British America, 2,220; from the United States, 1,287; from British Asia, 1,088; from Italy, 1,150. The total income of the library amounted to £9,974. Expenses amounted to £9,291, of which £5,012 was devoted to salaries and wages, £1,980 to purchase of hooks and manuscripts, £804 to hindings, £430 to printing and stationery, and £296 to light, heat, and water.

The first report of the lihrarian of State Institutions of Iowa is a matter of unusual interest, both to lihrarians and to specialists in the work of reform. It covers fourteen institutions, including two penitentiaries, two reformatories, a soldiers' home, an orphans' home, a school for the deaf, a college for the hlind, an institution for feeble-minded children, four hospitals for the insane, and one for inehriates. In general, the librarian reports, there is very little difference hetween the requirements of readers in these institutions and of those of the public lihrary:

> While it may he said that nearly all the inmates are ahnormal to some extent, yet for the purpose of book-selection only the insane may rank thus. . . . It is the Iowa idea that the hook has a function as a remedial agent, to he used with as much precision as any other remedy. . . . Ultimately, it is hoped that headings naming the types of patients with whom certain books may he effective will be incorporated with the book titles. In this way, for example, a doctor in search of a hook to give to a melancholy patient would find under the heading "Melancholia" a number of titles from which he could make a choice.

In a lecture, given at University College, London, last month, Prof. Flinders Petrie gave a report of the excavations of the British School in Egypt and the Egyptian Research Account during 1907. Though there were no epoch-making discoveries to announce, the season has heen fruitful in interesting finds. The first month's work was done at Gizeh. Here ohjects were found of the first, second, and third dynasties, showing that the first occupation of the site goes hack further than the fourth dynasty, to which it had hitherto heen ascribed. At Assiut, the site of the later months' labor, a large cemetery was discovered, with hundreds of tombs from the sixth to the twelfth dynasty. Among the ohjects hrought to light were imitation offerings for the dead (miniature representations of houses with tanks, as well as hoats with masts, oars, and cahins); the head of a fine coffin with gold foil and one shrouded in silver foil; several statuettes of good quality and workmanship (twelfth dynasty). In a later tomh of the nineteenth dynasty was found the first authenticated representation of a camel. Though there is evidence from the earliest times of the existence and use of this animal, no actual example had hitherto been forthcoming.

The French savant, Noël Valois, has discovered in the Imperial lihrary of Vienna a new polemical work dealing with Joan of Arc. It is a short but sharp reply to the work of the famous Paris university Chancellor Gerson, who, after Joan in May, 1429, had liberated Orleans, published a defence of the warlike maiden. This new pamphleteer is evidently a friend of the British side, and sees in Joan only a heretic, and in the devotion paid her only idolatry. The document, however, adds to our knowledge of her extraordinary influence among the people, as with those in authority.

The article of greatest interest to American readers in the *Annales de Géographie* for May is that of Fer. Maurette, on the reports of the Philippine Census. He closes a detailed statement of facts drawn from them by saying that they show what science and civilization demand of us. There should be further researches into the physical geography and geology of the islands, as well as into the hydrography, flora and fauna, which are not yet known scientifically; and the people should he transformed through the development of an active life, which the Spaniards were unable to accomplish. Americans should redeem the promise found "on every page of the census, to make another Japan of this land of the Far East." Prof. A. Demangeon treats of the value of Government documents in the study of certain geographic phenomena. This is suggestively shown hy an examination of the reports of the committees of agriculture and commerce of the National Assemhly, 1789-91, recently puhlished hy the Ministry of Puhlic Instruction. Many interesting facts are given, showing the changes wrought by deforesting, the taking of pastures for cultivation, the improving the means of communication, and the development of manual industries, resulting for a time in the exodus of workmen from the towns into the country. Among the other contents are a review of M. Paul Lemoine's studies in the geology of Madagascar, a topographical and geological account of Haut Poitou, with a map of the eastern part of the province of that name, and some notes upon the relations of the physical conditions of the Barcelonnette valley, in the Maritime Alps, to its inhahitants.

A new edition of Rose's "Life of Napoleon" has just heen issued by the Macmillan Co. The hook's reputation is well estahlished, and need not he insisted on. The present edition is a reprint containing no additional matter, hut the use of a very light paper permits the two volumes to he bound in one.

Charles E. Goodspeed of Boston puhlishes a heautifully engraved sheet containing "The Gettyshurg Address of Ahraham Lincoln." It is well worthy of framing.

The Rev. Percy Dearmer's "Parson's Handhook" of explicit directions as to proper Anglican use in all matters connected with the management of churches and the conduct of services has heen rewritten, considerably enlarged, furnished with several new and interesting illustrations, and issued in a sixth edition (Henry Frowde).

One of the more notable gatherings in Germany of progressive Protestants interested in religious and social movements, is the annual session of the Evangelisch-sozial Kongress. These assemhlies, held each year during the Whitsuntide holidays, attract large numbers from university and religious circles, and the platform of the Kongress has furnished the opportunity for not a few noteworthy utterances. Professor Harnack has been a leader in these meetings, and in a hook entitled "The Social Gospel" (G. P. Putnam's Sons), one may read in English his addresses on "The Evangelical Social Mission in the Light of the History of the Church" and "The Moral and Social Significance of Modern Education." The former may he noted especially as emhodying what is prohahly the attitude of the majority of German Protestants toward Socialism, and containing a clear exposition of the limitations becoming a religious body in reference to social reform. In the same volume may be found a translation of one of the most valuahle of the smaller treatises of the Marburg teacher of doctrinal theology, Wilhelm Herrmann. The paper, which was also a Kongress address, is entitled "The Moral Teachings of Jesus, Their Use and Ahuse." It is one of the clearest and most enlightening presentations of the relation of the ethical precepts of Jesus to the moral questions of to-day that have been made in recent years.

In the text of "Paris" (Painted by Mortimer Menpes. The Macmillan Co.) Miss Menpes takes her readers for a trip on the hoats of the Seine; leads them along the quays heside the river, pointing out the sights to be seen on the banks; climhs with them up the steep streets to the heights of Montmartre, dividing their attention hetween

the churches and the women to be seen by the way; conducts them along the Boulevard, stopping to watch the loitering public and the busy workers in the street, entering the cafés, and dwelling upon the art of dress in which the women excel. The life led in the Latin Quarter, the ambitions and gathering places of the students are sketched by her pen; something is said of the theatres and of excursions outside the city walls. She writes in a somewhat abrupt style; her series of pictures of Paris life have been jotted down in short, terse sentences, which somehow fail to match the grace and humor that float everywhere in the golden, hazy atmosphere of that city. Even the sandwich-man who strikes Miss Menpes as such a melancholy figure, is really a fair representative of gay French philosophy. Whereas in London, the man between the advertising boards drags his weary feet and shows his dreary countenance, trudging silent and stolid along the length of Oxford Street or Picadilly; in Paris, with the stub of a cigarette in his mouth, his restless tongue wagging unceasingly, his eyes rolling gayly, he walks beside his comrade in the narrow thoroughfare, or wanders in Indian file, throwing comments over his shoulders at everything his observant eyes see to amuse him. These things Miss Menpes does not convey. But her book, with its vivid descriptions, is a pleasant contribution. Some slight errors in the French, due probably to a printer's mistake, have crept in. There are twenty-four full-page illustrations in color, by Mr. Menpes, also numerous pen drawings as head-pieces, tail-pieces, etc., through the text.

Ernest Hartley Coleridge has prepared, and Henry Frowde has published, a really beautiful edition of "Christabel" for the Royal Society of Literature. The zest of the book lies in a facsimile reproduction of the manuscript of the poem as copied out by Coleridge for Mrs. Wordsworth's sister, Sarah Hutchinson, in 1800 or 1801. It is almost as if one had the handwriting of the poet before one's eyes. But the volume contains a good deal of matter besides this. The editor, from his minute and loyal knowledge of the subject, has furnished a long Introduction, giving the full history of the poem and conjectures toward its interpretation. And if when done with these guesses at the source of Coleridge's inspiration and with these guesses at its meaning, it seems that "we have been hunting for the end of a rainbow," the poem is still here, more tangible in a way, because looking as if direct from the poet's hand. The text is also given in ordinary print, with elaborate notes, and altogether the book will be a delight for lovers of Coleridge's shy muse. We cannot refrain from adding a few words from the criticism of the poem, in the *Monthly Review* of January, 1817, as quoted by the present editor; nor, we would add, is the reader to-day any less excusable for failing to see and in a way appreciate the point of view of that unfortunate critic than he would be for missing the rare loveliness of the poem itself. Said the Monthly Reviewer:

> This precious production is not finished! It would be truly astonishing that such rude, unfashioned stuff should be tolerated, and still more that it should be praised by men of genius (witness Lord Byron, and some others), were we not convinced that every principle of correct writing, as far as poetry is concerned, has long been *given up*; and that the observance rather than the breach of such rules is considered as an incontrovertible proof of rank stupidity. It is grand, in a word it is sublime, to be lawless; and whoever writes the wildest nonsense in the quickest and newest manner is the popular poet of the day.

Those who wish to be informed on the controversy between France and the Vatican cannot do better than read Paul Sabatier's "Lettre ouverte à S. E. le Cardinal Gibbons à propos de son manfeste sur la séparation des églises et de l'état en France" (Paris: Librairie Fischbacher). It is a response to Cardinal Gibbons's address of last January, which was widely circulated in Europe. M. Sabatier meets specifically and it seems to us convincingly the charges that the Separation Act was inspired by hatred of religion in general, that it ignored the rights of property and the constitution of the Church, and that its effects would be disastrous to the Church in France. Indeed, it seems clear that the Cardinal Archbishop not only misrepresented unwittingly the terms of the Concordat, but also spoke on partial information concerning the Separation Act itself and the attitude of its advocates, ignoring as well the division of opinion as to conformity between the Pope and the majority of the French Bishops. In fact our attitude has been practically that of such French Catholics as the Marquis de Vogüé, Count Haussonville, and the late Ferdinand Brunetière. For persons who approach the subject impartially his pamphlet will be enlightening. In particular it points out trenchantly the distinction between Catholics as members of a faith and Clericals as members of a sinister political organization seeking the aggrandizement of the hierarchy. This elementary but all important distinction is too often forgotten in America, but it is the Clerical *imperium in imperio* that really makes the trouble. The patriot Gambetta truly saw there the "enemy" of the Republic. M. Sabatier does not deal with the real if formal grievance that the Vatican was not consulted in the manner of the Separation. Treaties are frequently denounced, but it is at least either unusual to take such a course without first sounding the other party or to conclude such a one-sided repeal of a contract by breaking off diplomatic relations. On the other hand, the Vatican has subsequently displayed so complete an incapacity for grasping either the moral or practical aspects of the situation created by the Briand Law, that one may fairly assume that preliminary negotiations, which would have put the French Government in a more correct position, would have been merely nugatory. M. Sabatier's little tract is throughout inspired by a protestant love of the Mother Church and by mistrust of the Curia. He hopes for a reform within the Church, and feels that a profound inner crisis is at hand. The hierarchy is, he finds, "in about the same moral situation as the Synagogue a half-century before Christ. It has its sanhedrin, its scribes, its doctors, and its pharisees—an entire band of officials and dependents — who see only the external structure, who adore the letter, and say to themselves that what has sufficed for so many centuries should suffice still." How the reforming Catholics are to make themselves felt short of secession is a question that M. Sabatier does not raise, and indeed it would be too large a matter for this small but meaty pamphlet.

The death is announced from Egypt of Mary de Morgan, daughter of Prof. Augustus de Morgan, the mathematician, and sister of William de Morgan, the novelist. Her fairy tales, "On a Pincushion," "The Necklace of Princess Florimonde," and "The Windfairies," have given wholesome entertainment to many children.

Miss Julia Magruder died on Sunday at Richmond, Va., after a long illness. She was born in Charlottesville, Va., in 1854. She began to write in her early girlhood; her first published story, which appeared in the *Southern Magazine*, was written when she was eighteen, and her first novel, "Across the Chasm," was published in 1885. This novel—a civil war romance—was issued anonymously, and by its frank comment on the faults of the Northern and Southern characters aroused a good deal of discussion. In 1887 appeared two other novels, "At Anchor," and "A Magnificent Plebeian," but her first real success followed the serial publication in the *Century* of the "Princess Sonia." Her last novel, "The Thousandth Woman," was published in 1905.

GENERAL ALEXANDER'S MEMOIRS.

Military Memoirs of a Confederate, a Critical Narrative. By Edward Porter Alexander, Brigadier-General in the Confederate Army and Chief of Artillery, Longstreet's Corps. New York: Charles Scribner's Sons. $4 net.

Gen. Alexander left West Point in 1857, according to Cullum's Register, third in his class, which rank gave him a place in the engineers, the *corps d'élite*. At the secession of Georgia, his State, he hurried to the front, and did good service at the first opportunity. Having been concerned in the development of the flag-system of signalling, he was assigned to that. At Bull Run, catching from his high station the gleam of arms eight miles away toward Sudley Springs, he notified Beauregard that his left was turned and that McDowell's attack must be prepared for. Thenceforth to the end he was in the thick of the war, usually at the side of Longstreet and close at hand to Lee. April 9, 1865, Grant's cordon being then complete, he formed Longstreet's corps in line of battle, with the design of breaking through, thus directing the last hostile demonstration of the Army of Northern Virginia. Seasoned in such a school, he went home a veteran, though, as a portrait of the time attests, he was in face and figure scarcely beyond youth.

His book, of great interest to the general reader, though intended particularly for military students, details the campaigns of the Army of Northern Virginia with criticisms of its operations throughout. It takes no note of political or social conditions, and only in the preface touches on the merits of the question in dispute. Here Alexander declares with manly candor that "what we fought for no longer seems so desirable," and that had the South won, "it would now prove only a curse." His recognition of the blessing of the rescued Union

could not be heartier. We find in the book two general defects, a supply of maps quite too scant for following out the narrative, and a lack of references to authorities. The reader often encounters statements new, perhaps antecedently improbable, for which he would like to have chapter and verse, but foot-notes are few and meagre.

In Alexander's criticisms so famous a leader as Joseph E. Johnston fares badly. The battle of Fair Oaks, May 31, 1862, was "phenomenally mismanaged," and his disabling on the field was fortunate, since it brought Lee to the front. The Atlanta campaign is out of our writer's scheme, but in his brief allusion to it there is no recognition of merit in Johnston's conduct. This judgment, we think, might be challenged. While the disciple of Lee is full of love for his master, he finds as a critic his opportunity, and is always frank. Lee's first campaign, that of the Seven Days, was marked by errors. Alexander does not go so far as Dick Taylor (in war time it was affectation to say Lieut.-Gen. Richard Taylor), who in his "Destruction and Reconstruction" calls this campaign "a series of blunders each one huge," but errors are found which must in part be assigned to the commander-in-chief. How could it be otherwise? War is the most difficult of arts; the great general is not born but made; for Lee the Peninsular Campaign was 'prentice work.

The inaction of Stonewall Jackson during the Seven Days, the critic holds to have been gravely culpable. Longstreet and D. H. Hill, in their writings, do not conceal their dissatisfaction at their colleague's conduct, by which they themselves greatly suffered; and Lee, even after the war, according to trustworthy tradition, felt a rankling resentment at the course of his famous lieutenant. But we think no such plain exposition of the derelictions as that of Alexander has heretofore been made. Jackson's troops were observing Sunday or in camp-meeting when there was pressing need for them on the march and in battle. Moreover, exaggerating the work of his own men in the Valley campaign, and depreciating the service of the corps which had fought at Williamsburg and Fair Oaks, and kept McClellan out of Richmond, he deliberately kept his men out of action, leaving the brunt to be taken by other commands. Jackson's conduct as depicted in this book would seem to justify a court-martial. It was a temporary eclipse, thinks the critic, who, like the world in general, believes Jackson's soldiership, both before and after, to have been uniformly almost matchless.

Looking at the matter of grand strategy, Alexander believes that the Confederacy did not utilize as it might have done the advantage of its interior lines. By a transit of a few days armies could be sent from the Atlantic slope aeross the mountains into the Mississippi valley and vice versa, thereby making it possible before a great effort to mass troops heavily in the East or West, as occasion might require. This opportunity was not seized until the Chickamauga campaign, when through the capture and destruction of railroads, the advantage had been in great part lost. A better move for Lee in the fall of 1862 than the one into Maryland, would have been the sudden sending of a powerful reinforcement into Tennessee. At that moment Bragg, having evaded Buell, was marching north into Kentucky, where, joined by Kirby Smith, he presently threatened close at hand both Louisville and Cincinnati, then poorly defended. We incline to think that a few divisions, which Lee, during the panic of the North after the August disasters, could have easily spared, transferred to the Western army, might have made possible an invasion of Ohio that would have carried the Confederates to the Lakes, so splitting the North in two. Alexander holds that this use of interior lines would have been preferable to the attempt in Maryland, which failed of ending in a Federal triumph only because McClellan was inadequate to the situation.

Before Gettysburg, Lee neglected again to profit by his interior lines. In May, 1863, Vicksburg, in danger from Grant, was not beyond rescue. Had the Confederates at Chattanooga been at that time reënforced across the mountains from Virginia, and a strong army under Lee's command advanced rapidly upon Cincinnati, Grant might have been drawn away from the threatened fortress; or, if not that, the undefended line of the Ohio might have been crossed with prospect of a great result. Longstreet, who strongly advised this, was then returning from Suffolk with 13,000 veterans, and in two or three days might have made the transit. Unfortunately for the Confederacy, thinks Alexander, this plan was rejected. The one preferred, initiated by a false move, was soon marked by a second error: Lee ordered, or suffered, Stuart to depart with the cavalry, thus leaving his army without eyes and ears until the afternoon of July 2, with no compensating advantage. Coming to the actual battle, our critic spares neither high nor low. The excellent Federal position, the "fish-hook" curving about the heights, making easy the strengthening of endangered spots by interior roads, rendered necessary for Lee a bad formation. Meade might have been manœuvred out of his position and forced to fight at a disadvantage. Lee chose battle then and there, and judged incorrectly in his assault. "The one weak spot of the enemy's line [a point on Cemetery Hill which might have been enfiladed], and the one advantage possessed by ours, were never apprehended." All the corps commanders came short: "Few fields furnish examples of worse tactics." Meade, meanwhile, ably seconded by Hancock, afforded, especially on the second day, "perhaps the best example which the war produced of active supervision and effective handling of a large force on the defensive." With the third day at Gettysburg, the pages become thrilling. Longstreet, reluctant to throw in at Lee's command his last division, imposed upon his young chief-of-artillery, standing among his smoking guns, the responsibility of deciding as to the opportune moment for Pickett's charge. Now began Alexander's part in the chapter of errors. He was at first appalled, but finding Pickett confident, he was so far reassured that, mistaking a lull in the Federal cannonade for proof that it was silenced, he dared to give the word. In the story of the charge and recoil, the interest of the book culminates. Though Meade had fought a brave and skilful battle, it is here made plain that his error was enormous in refraining from pursuit. As one reads here the details of Lee's retreat, the almost agonized cry of Lincoln comes to mind: "The army held them in the hollow of its hand, and all I could do or say could not make it close."

In the Wilderness our critic believes that the disabling of Lougstreet while executing his movement on Hancock's flank saved Grant from a Chancellorsville, just as two years before the taking-off of A. S. Johnston at Shiloh saved Grant from ruin—both of which judgments, were there time, we might dispute. But as to the conduct in general by Lee of his great campaign of 1864, we admit all that his friends claim: it was a masterpiece of soldiership, the application, intrepid, persistent, unerring, of slender means to the beatiug back of mighty dangers. We believe that Lee grew as a soldier, that he did better in June, 1864, than he had done on the same ground in June, 1862. Longstreet records the opinion that as a defensive leader Lee was without fault; on the offensive he thought him "over-combative." This extreme aggressiveness won for him at Second Manassas and Chancellorsville, but involved him in such catastrophes as Mechanicsville. Malvern Hill, and Gettysburg. In 1864 this excess of fire had become tempered. Each thrust of the ponderous Federal lance met an effective parry, and woe befell his adverversary if by chance an avenue of approach was left open. Since Moltke, writers upon the art of war have insisted upon the necessity of a proper general staff. Like G. F. R. Henderson, probably the most competent foreign critic of our civil war, Alexander, too, attributes such misfortunes as befell the Confederacy in the field largely to poor system and organization, a lack which a suitable general staff might have made good. This view may be accepted, Here probably the Federals were better off, for whom at the start McClellan rendered such a service.

In this book the chiefs of the Army of the Potomac are naturally figures much less distinct than their great adversary, and receive little commendation. McClellan in the field is not praised; whereas Dick Taylor extols highly the change of base to the James, in 1862; and Lee is known to have spoken of him with respect. Meade's good conduct at Gettysburg is, as has been seen, recognized, but also the strange inertia that followed. For Grant words of approval are few and measured. The one operation for which the critic has a hearty utterance is the transference after Cold Harbor of his army to the south side of the James, whereby he gained au excellent point of vantage before Petersburg. Nothing came of it, however, all the opportunities being somehow lost. It is well known, says Alexander, that in those days Grant was "not abstemious." We think a word or two might have well been said about Grant's heavy handicap. A complete stranger in his army, he was embarrassed on every side; he was forced to suffer, for unmilitary reasons, as commanders of his coöperating armies such men as Butler and Sigel; he had always at hand an Administration and Congress whose ardent and patriotic zeal was yet so often sadly without knowledge. This, we think, might have been more fully recognized—and also the iron force of character which through a year of almost unbroken defeat and humiliation wrought out

a great end—no other than the rescue of the Union, which Gen. Alexander, with all other good Americans, has come in these latter days to esteem so precious.

The Army of Northern Virginia fought a good fight, which has not been better set forth than in this book. At the close Gen. Alexander warms into exultation which we can pardon; with which, indeed, we can sympathize, for it is a record of the achievements of good American heads and hearts. No preceding book by a Southern soldier surpasses this in good temper, wise discrimination, and graphic portrayal. Nor is it likely to be paralleled hereafter; for we have witnessed the passing of Arthur; and of the retinue in whose van once flashed Excalibur, it is only here and there that a good knight survives.

CURRENT FICTION.

Mother. By Maxim Gorky. New York: D. Appleton & Co.

A general public which connects the name of Gorky with squalid realism and moral laxity should read this moving and human story. Hardly elsewhere has Socialism spoken with a voice at once so deep and so gentle. Fallacy though it be, with its virtual denial of the rights of any other labor than that of the hands, it is not an ignoble fallacy. It is not, at all events, a gospel which mainly tempts the ignoble. Among the large company of Russian Socialists whom Gorky portrays, and many of whom are sharply individualized, there is not one who is not made more human by his creed, and by the disinterested activity to which it leads. Above all, this is true of the central figure, the "Mother" whose spirit, once roused, broods over a whole movement, and who finally gives her life for it, triumphantly.

Her life begins with the death of her husband, a drunken savage whom she has married in blind obedience to the mating instinct. The son who is left to her bids fair at first to become a brute like his father, out of sheer inertia. But there are finer elements in his nature which rebel in time. He begins to question as to the meaning of things, falls in with other inquiring minds, reads much, thinks much, and before long is committed to the socialistic propaganda. When the mother discovers the nature of his studies, she is at first greatly terrified, dimly imagining that her son is giving himself to a new and worse form of wickedness. She meets some of his companions and finds them, to her surprise, simple and lovable people. She hears them talk, and by degrees comes to an apprehension of what they are striving for. They begin to count upon her, first for sympathy, and later for active help. The son is imprisoned, and she becomes bold and adroit in distributing the forbidden literature which it has been his task to distribute. She becomes a power among her people. The maternal instinct is always the mainspring of her action, but her sphere of influence is continually enlarging. The story itself moves slowly, or rather it is a series of leisurely episodes, described in great detail, in the life of a particular band of social revolutionists. There are arrests, escapes, conflicts with the police, and always the harangue. But these people are more interesting than their theories or exploits. Full of Slavic fire and ingenuousness, they move in the pure air of martyrdom; and yet they are human, varied in temperament and point of view. There are two or three humorists among them; and the general disposition, if not the general ability, is to see more than one aspect in the face of things. So each in his several way bears witness to the truth as he sees it, for the good of all, and goes his way. As a group, they embody whatever is good and pure, if not whatever is wise, in the revolutionary theory and practice.

The Price of Silence. By M. E. M. Davis. Boston: Houghton, Mifflin & Co.

Is it permissible for the Northern mind to express itself freely, for once, upon this type of Southern story? We confess ourselves thoroughly tired of colonel-worship, and protest against being further called upon to admire the post-bellum fire-eater, with his easy personal morals, and much-flaunted ideals. This is the type which howls loudest about miscegenation, and is largely responsible for the curse of mixed blood which is now upon us.

This is the one American type whose chivalry toward the other sex is most trumpeted, and whose chivalry restricts itself to the members of its own social order. These are the drunkards, gamblers, deadbeats, who, with a few flourishes of external courtesy, a little of the old-school business, are supposed to qualify as heroes of romance. Let us have done with them. The Major Grandchamps of the present tale is not the central figure; but his code, his atmosphere, are the code and atmosphere of the story. It is considered creditable to him that in telling the story of a Northern military outrage, he smashes glasses and spills wine upon the table at a formal dinner, by way of emphasis. His hostess sells her granddaughter to a man whom she knows to be a low rascal. This also is admirable, since it is to save the family "honor." The rascal, being a poor white, the son of a Northern officer, has had no choice but to be a rascal; unfortunately he impresses one as a very rough sketch of a villain. It is hard to preserve respect for the maiden who tolerates him, even for a moment. Of course, he does not actually carry her off; but we should not care much if he did. We suspect that the story is of a sort to be widely read, and to be generally taken, at least in the North, for a true and pleasing picture of Southern types and Southern life. We protest against such acceptance of it, and decline to believe that this colonel-myth is anything but a travesty of the truth.

Catherine of Calais. By Mrs. Henry de la Pasture. New York: E. P. Dutton & Co.

This story is of much the same quality as the same author's recent "Lonely Lady of Grosvenor Square." It is not at all a modern quality—quite frankly, indeed, a reversion to the broader mid-Victorian vein. Here are no problems, no emancipated women, no tribulations of the artistic temperament, no messages to humanity. Here is, if you will, humanity itself, in one or two of its more ingenuous aspects, at least. The action moves in an emollient air of sentiment upon the ingenuously mercenary sphere of British life with which the very best authors have familiarized the world at large. Matters are comfortably adjusted between the simple heroine and the noble hero by the always pleasant if familiar expedient of making the lady an heiress. Catherine, to be sure, is wed because she ought to have been an heiress, and the baronet in question, who really inherits the money, is disposed to make amends according to his lights. He has further discovered that the girl is in love with him, so that his path of magnanimity is extended. The fact that he is an intolerable prig and bore does not lessen her gratitude or worship. Nor, save for one moment (when he treats her sternly for her pains), does she betray uneasiness that he fails to return her romantic feeling. She is, in fact, a silly and meek and dutiful and loving little creature, one of the Amella Sedleys who do not become extinct in life, whether they are to be found in fiction or not.

The Tree of Heaven. By Robert W. Chambers. New York: D. Appleton & Co.

In these trim, carefully upholstered, and perfectly magazinable tales, Mr. Chambers draws less heavily upon the patience of the unfashionable reader than in most of his recent work. The persons, to be sure, belong to the upper-tendom of Mr. Chambers's fancy, and move in that atmosphere of luxury, of scents and silks, jewels, champagne, valets and motor cars, with which this writer has always been so much impressed. But his substance is not merely another rehearsal of the manœuvres of the stupidly stylish as such. His people cannot endure to be low; but their concern here is with the occult; and the series of fanciful tales which ensue are very good of their extravagant kind.

The Siamese Cat. By Henry Milner Rideout. New York: McClure, Phillips & Co.

This is a book which tempts the reviewer to cast propriety to the winds and call it in cold print a thundering good story. It moves at lightning speed, but its background of Siam, Singapore, and Port Said is such a flashing kaleidoscope that it reduces to ordinary motion the antics of figures projected against it. The story revolves about a cat—a realistically impersonal, inscrutable cat—silver collar, a ruby, and a nice pair of young Americans; with disturbances in the shape of crafty Orientals, pugnacious Occidentals, and international scoundrels. The balance of values between story and setting is kept with an artistic discretion the more to be praised that the Orient offers so strong a temptation to over-production in landscape. Siam, an unexhausted field, must have been a particular snare to the injudicious. Mr. Rideout pictures it in an atmosphere that can be felt, yet the story dashes on unhalting, showing that the author is one of the endowed few who can run and paint at the same time. The excursion to the ruins at Ayuthia carries one into a forgotten past as effectively as if a seal-brown cat were not jumping through the Buddhistic calm. The little romance, too, is agreeably spontaneous. It sits close to the cat and rides skimmingly in perfect companionship.

The book is essentially modern, the law-

ful offspring of the age—a derivation, but no imitation. In a general way it may be labelled "School of Kipling," so far as geography and customs are concerned, while for story and in sub-classification it is related to sundry of our younger authors, who, by the light of the Cubau war, have developed the journalistic telegram into the novel of adventure. It is interesting to wonder what the classic fathers would have thought of the polyglot of such stories; of the strange foreign words that walk all unsponsored among their mates; of the "charpoy" and the "gharri chit" and the "prachadees" and the "Tum Tum Cart with a Waler." The latter-day reader, however, is a seasoned vessel. And as for *molestam senectutem*, even it must be inelastic and hide-bound not to be swept along by the tide of this ingenious story.

The Woman. By Antonio Fogazzaro. Translated by Thorold Dickson. Philadelphia: J. B. Lippincott Co.

The success of Fogazzaro's recent religious fiction has no doubt been the occasion of this resuscitation of an early romantic novel, "Malombra," which seems to be almost the work of a different man. Here is mystery and witching scenery and everything that entranced lovers of fiction a score of years ago, and have interest for most of us to-day, if we only permit it. The translation is in excellent, idiomatic English, and to one reader at least has brought back happy memories of his first introduction to Italian in this leisurely novel.

The Origin and Development of the Moral Ideas. By Edward Westermarck. Vol. I. New York: The Macmillan Co. $3.50 net.

This new volume by Dr. Westermarck, so favorably known through his "History of Human Marriage," published in 1891, is much more than a summary of the labors and opinions of others, since it contains also a good deal of first-hand knowledge obtained by the author during four years spent in Morocco, chiefly among the peasants and mountaineers. The twenty-seven chapters cover a wide range within the field selected for investigation: The origin, nature, and expression of the moral emotions, concepts, ideas, and judgments; influence of external events, motives, the will, intellectual disability; forbearance and carelessness, character and conduct; homicide of all varieties, human sacrifice, blood-revenge and compensation, capital punishment, the duel, bodily injuries; charity and generosity, hospitality; the subjection of children and women, slavery, etc. In this first volume of a work intended to discuss the origin and development of our moral ideas, to classify, and, as far as it is possible so to do, to explain them as "rooted in the emotional side of our nature," but, nevertheless, "in a large measure amenable to reason," Dr. Westermarck adduces evidence from all quarters of the globe. In acquaintance with the literature of the subject, his work stands out in marked contrast with certain Continental European and even English books upon kindred topics, whose neglect of the investigations of American anthropologists is all too glaring. The writings of Dr. Boas, *e. g.*, ought to be utilized by every author who attempts to generalize about the mind of primitive man. The author's general position is indicated in the following passage (p. 9):

> Society is the school in which men learn to distinguish between right and wrong. The headmaster is Custom, and the lessons are the same for all. The first moral judgments were pronounced by public opinion; public indignation and public approval are the prototypes of the moral emotions. As regards questions of morality, there was, in early society, practically no difference of opinion; hence a character of universality, or objectivity, was from the very beginning attached to all moral judgments. And when, with advancing civilization, this unanimity was to some extent disturbed by individuals venturing to dissent from the opinions of the majority, the disagreement was largely due to facts which in no way affected the moral principle, but had reference only to its application.

There being really "no absolute standard in morality," the best position to take up is that of "ethical subjectivism," in assuming which Dr. Westermarck expresses himself optimistically, thus (p. 20):

> Far above the vulgar idea that the right is a settled something to which everybody has to adjust his opinions, rises the conviction that it has its existence in each individual mind, capable of any expansion, proclaiming its own right to exist, if needs be, venturing to make a stand against the whole world. Such a conviction makes for progress.

Moral disapproval is a sub-species of resentment and moral approval a form of "retributive kindly emotion." The self-side of the question is stated thus (p. 107): "In order to be moral emotions, our self-condemnation and self-approval must present the same characteristics as make resentment and retributive kindliness moral emotions when they are felt with reference to the conduct of other people." In the long history of mankind the factors which have stimulated or retarded the development of moral ideas have been numerous and varied. Among them may be mentioned: The publicity of the earliest moral emotions (still powerful in dictating certain forms of punishment in use among civilized nations); the occurrence of a marked "sense of duty" and the like in races counted with the uncivilized (some negro peoples, *e. g.*, are said to have a sense of duty rather superior to that of Europeans); the value of customs (and "bad habits") as representing the moral ideas of peoples; the connection between the punishments prescribed by law and the religious-aristocratic form of government; the attitude of human races and peoples toward intentional and accidental injuries; the recognition of intellectual disability as creating irresponsibility (animals, children, women, idiots, madmen, drunken persons, etc., have all been so considered; but, at the same time, some peoples have visited crimes committed in a state of intoxication with double penalties, while being very indulgent to the act of drunkenness when not accompanied by injurious consequences); the idea of the contagious character of "sin," involving often the innocent as well as the guilty (this idea is often carried to the extreme under the régime of religious dogma); the doctrine of family solidarity, which carries in its train not only common responsibility for crimes, but common enjoyment of merits and virtues as well; the prominence in early moral codes of negative commandments (the differences between the Old and the New Testament morality illustrate this); the strong belief of the popular mind in the law of cause and effect (theories of fate and destiny, etc.).

In his discussion of homicide and human sacrifice, Dr. Westermarck examines much interesting material. He properly remarks (pp. 328-329) that, whereas among uncivilized peoples human life is generally held very cheap, "there are, on the other hand, uncivilized peoples among whom homicide or murder is said to be hardly known." The allusions to the sparing of the lives of captives, the disapproval of homicide in times of peace, etc., might be greatly increased by a comparative study of "fairness" in war and its concomitants. The custom, known to many savage and barbarous peoples, of killing the old and decrepit, and of abandoning or putting out of the way deformed and diseased individuals, recalls the ever-recurring proposals of some physician or advocate of the strenuous life of to-day. Their fellows of another race are to be met with in the Mongolian Hakkas, who "often put their girls to death with a view of inducing thereby the soul to appear next time in the shape of a boy." At page 465 a reference is in order to a recent article by Professor Toy in the "Journal of American Folk-Lore" (1905) on "Mexican Human Sacrifice," in which the ambassadorial nature of ceremonial slaughter is dwelt upon. The recent monographs of Dr. K. T. Preuss give some ground for the belief that with certain peoples human sacrifice is a comparatively late cult-phenomenon; the human being in this case is the substitute and not the thing substituted for. The execution of blood-revenge, Dr. Westermarck thinks, "largely falls under the headings of human sacrifice for the dead." The duel is styled (p. 507) "a sanguinary survival of barbarism," but it has often been more sanguinary in civilization. That corporal punishment is the greatest of indignities for adults or for children is believed by not a few savage and barbarous peoples, some of whom see in injury to the body a corresponding injury to the soul. The religious duty of charity, according to the author, "is not merely an outcome of the altruistic sentiment," for, although "the most beautiful of all religious virtues," charity may be "traced back to a magical and ritualistic origin." Hospitality, too, has thrived much from belief in the "magic power" of the stranger and the desire to make sure of his blessings ("entertaining angels unawares" is known all over the globe and in every age).

In the matter of the subjection of children and wives, the treatment accorded the dead has not been without influence on the attitude assumed toward the living, the magnification of ancestors often resulting in the practical exclusion of women and the creation of entirely male genealogies and pantheons. A more complete knowledge of the position of woman among savage and barbarous peoples than is possessed by some recent writers on this subject, enables Dr. Westermarck to question the statement that "a people's civilization may be measured by the position held by the women"—an assertion, "not

supported by facts, at least so far as the earlier stages of culture are concerned."

Dr. Westermarck's book makes good reading for all who are interested in the evolution of human ideas and human institutions, from the tariff to woman suffrage, and from capital punishment to the elective system in colleges and universities. Out of the great array of facts accumulated and discussed stands forth time and again the human compromise between emotional zeal and the cooler thought of reason, which has made possible modern civilization and its continued evolution.

Etudes Critiques sur l'histoire de la Littérature Française. Par Ferdinand Brunetière. Huitième Série. Paris: Hachette et Cie.

A posthumous volume like this of Brunetière's is always likely to attract a rather unusual sort of interest. Final and definitive as it is in the obvious sense, it seems too as though it had settled conclusively the general character of its author's thought. It is difficult to view such a book otherwise than as a "proof," a kind of literary cast of the writer's criticism. There are the familiar ear-marks—the labels and catch-words in quotation, the ostentation of "science," of "evolution" and "psychology," the historical "deductions" and "derivations," the "shop," and what not—set as though in plaster; everywhere the unmistakable impression of a method scholarly, laborious, conscientious, at times ingenious and even profound in its own fashion, but fatally ponderous, constrained, and rigid like the operation of a piece of complicated and inflexible machinery.

Take the essay on the "Maladie du Burlesque," for instance; nothing could be shrewder than its reduction of romanticism to a common category with "preciosity" and burlesque—"the mélange of preciosity and grotesqueness which was romanticism"—and nothing less convincing; unless it is the plea for infallibility in connection with De Maistre's "Du Pape," with its air-tight logic and formal paradox. Infected with a little of the old mediæval leaven, in spite of his detestation of romanticism, Brunetière seems in the end to have forgotten entirely the tacit surrender of absolute truth which underlay the Reformation and which furnishes the foundation of modern tolerance. In particular his recurrent flings at Sainte-Beuve—and he appears to have made one every time he had a chance—are unmistakably significant. "In those justly admired pages in which Sainte-Beuve set himself to characterize Montaigne's style . . . just fancy, if you can, the historian of Port Royal as thinking less of himself than of the author of the 'Essais.'" And then Sainte-Beuve's scholarship! "When a critic has to speak of a writer's development, he ought to make more account of chronology than was the fashion in Sainte-Beuve's day." For this is no mere pedantry. Much less is it petty jealousy or incompatibility of temper in the ordinary sense, which sets him carping at his illustrious predecessor. It is, rather, the hopeless antagonism of two rival philosophies; the one conceiving truth as something Protean, mutable, wayward, tricksy, elusive, not to be coerced—though wheedled, perhaps, with infinite ingenuity, resource, and versatility; the other, on the contrary, believing it stable, rooted, immutable, a thing to be stared at and reasoned with and talked down; the former trusting by ceaseless agility of spirit to surprise occasionally a kind of relative certainty; the latter depending upon its persistence and inflexibility to discover the whole mystery sooner or later.

That Brunetière's natural stiffness of temper was confirmed by his lack of sympathy with his own age, an age of weak and dissolute criticism, is undeniable. On this ground is to be explained his assertive and disputatious tone, as when men are obliged to be always taking their own part. He was in the opposition and the minority. And it speaks wonders for the man's energy that he should have secured so large a share in writing the report of the period, which is usually the work of the majority. For, in spite of certain superficial resemblances, especially in the use of the modern critical machine, Brunetière differed radically from his contemporaries and his immediate predecessors in his innate respect for authority. He recognized early and correctly that the crying need of his time was a just and properly constituted principle of authority. His failure as a critic consists in the fact that he never succeeded in supplying this need. Unfortunately for himself and for us, the authority that he had to offer was thoroughly inadequate. By the circumstances of the case, it was limited too exclusively to tradition, and tradition interpreted and applied in a partial and rather unfortunate manner. Without a regard for tradition there is no sound opinion possible. But at the same time, without a sane body of current opinion, without an elevated contemporary common-sense, tradition itself is but an inelastic and useless criterion of truth. And it was Brunetière's misfortune that no such consensus of public opinion existed in his day with respect to the things of the spirit. What sound opinion he saw about him as representing the best sense of his own day was scientific rather than literary; and it is hardly astonishing that in the absence of any other guide he should have listened to it too confidingly and should have misread by its light the past as well as the present. For the main thing with science, as he saw, is reality, not moral truth, and its instrument is observation, not creative imagination; and it is just this reality, this observation, that he is finally induced to accept as the standard of literature—an error in which he was confirmed, no doubt, by the appearance of a scientific tendency or evolution in the recent history of human thought. "Every work in every language—and I am tempted to say, in every art—will be classic in proportion to the amount of psychological or moral *observation* it contains—and be-like, in virtue of this alone." Hence his excessive admiration for Balzac, whose method of composition he cannot refrain from comparing conjecturally with Molière's. Hence, too, what seems at first sight a curious inconsistency in matters of faith, where science gives him no guidance and he is obliged to turn over the test of truth to the traditional authority—a dualism between reason and dogma, which he seems to think quite in Montaigne's line. But whether he is judging of literature by its "psychological and moral observation" or of doctrine by its agreement with "consecrated dogma," he is always an absolutist, with this one desperate conviction fixed in his mind that, wherever the subject, certainty is somehow or other attainable and capable with pains and patience of being exactly defined and formulate.

The Measure of the Hours. By Maurice Maeterlinck. Translated by Alexander Teixeira de Mattos. New York: Dodd, Mead & Co. $1.40 net.

The central interest of this volume is not the brief and fanciful study which gives it its name, a discussion of the qualities and aspects of time, and its appropriate measurement by sundials in summer's divine leisure, hour-glasses that shall muffle in sand the season of grief, and so on. That is Maeterlinck in his lighter vein, and it shows only here and there a touch of the almost tragic seriousness that is the predominant note of his philosophy. The present collection of twelve essays is, like "Le Double Jardin," somewhat heterogeneous, and ranges over questions of morality, social duty, literary appreciation, scenery, and popular science. The longest essay, which in the French original gives its title to the volume, is among the first-fruits of Maeterlinck's studies of plants that seem to show signs of reasoning. In "The Intelligence of the Flowers" is foreshadowed, no doubt, a larger work, the counterpart of "La Vie des abeilles," and we have now in general terms the results of the last four years' work, which this versatile writer has devoted to the hybridisation of sages. Nearly all that he tells us about the wisdom and ingenuity of flowers is, of course, known to botanists. But few botanists write books which appeal to the layman as does Darwin's, "On the Various Contrivances by which Orchids Are Fertilized by Insects," and here we have, with more subtle suggestions and comments than came within Darwin's scope, the story of the soul of the flowers, and their heroic efforts at mechanical invention. Their immediate effort is always to conquer space: hence all the marvels that they have achieved, after experiment, in the line of propulsion, and navigation of the air, "the aerial screw of the maple; the flying-machine of the thistle; the detonating springs of the spurge; the extraordinary squirt of the momordica; the hooks of the eriophilous plants; and a thousand other unexpected and astounding pieces of mechanism." Aristotle, one remembers, allowed to plants only the "nutritive soul"—whatever he may have meant by the phrase. Maeterlinck offers the hypothesis that "there are not more or less intelligent beings, but a scattered general intelligence, a sort of universal fluid," for which man happens to be a better conductor than animals or plants. Any manifestations of this intelligence outside ourselves are precious, since they indicate that man has not taken the wrong road; that "the methods of the human mind are the only possible methods, that man has not erred, that he is neither an exception nor a monster, but the being through whom pass, in whom are most intensely manifested, the great volitions, the great desires, of the universe."

In "Le Double Jardin" Maeterlinck wrote a prose ode to the "half-human" automobile, in which he promoted speed to a place beside or even above the deities space and time. In an essay on the "Psychology of Accident" he now analyzes the workings of the reason and of instinct in an automobile accident, for the automobile, above all other means of violent death, seems designed for those who love the "bright face of danger." The sixth essay, "Rome," appeared in "Le Double Jardin," and is here translated. In "The Praise of the Fist" Maeterlinck betrays a tendency, which, to his admirers, is depressing—a tendency to show off. In "Le Double Jardin" he wrote a piece—it cannot be called an essay—called "Éloge de l'épée." Now we have its counterpart, in which he takes the other side. These panegyrics have too many of the earmarks of those tasteless efforts of rhetorie with which the Græco-Roman sophists used to delight audiences that would have found extension lectures too taxing on the brain. To be all for the sword as against the fist, in an epideictic speech, one day, and to reverse one's position on the morrow, in a speech just as clever, was an exercise that pleased all tastes by its ingenuity, and the theme mattered not at all. Such a *jeu d'esprit* is unworthy of Maeterlinck, and one is even tempted to doubt the sincerity of some of the philosophical essays when one sees him expending the same subtlety, the same suggestive reflections on both sides of an ornamental debate. There is a sophist in every philosopher, but the best of them have curbed the rhetorical talent as inappropriate to the votaries of truth. The main interest, however, of nearly all these essays is essentially that of the earlier volumes; the aim is still to combat insensibility to the possibilities of unguessed mysteries in what lies around us. Maeterlinck would have men live with a lively sense of great plans and purposes, and pursue, as far as the finite mind can, the meaning of nature's "fearful symmetry"—would have us feel that we play a part in a vast drama whose dimensions and *dénouement* we cannot comprehend.

The Life of Isabella Bird (Mrs. Bishop). By Anna M. Stoddart. E. P. Dutton & Co. $5 net.

This life might have been better in one way, at least, if it had been written by a man. Mrs. Bishop played a man's part, and it would be interesting to know how her performance appeared to the expert. Miss Stoddart is rather too much rapt by mere reverential admiration of the great traveller. That feeling the reader could supply for himself. He wants more explanation. He would like to hear more about the comparative psychology of this strange woman. He wonders how Mrs. Bishop managed to do what she did, and how her feats rank among similar male enterprises. On these points Miss Stoddart is hardly sufficiently informative. She writes as a sentimentalist rather than as a psychologist. The value of her work lies chiefly in the account it gives of the scope and results of Mrs. Bishop's journeys. To many readers, no doubt, it will be interesting enough, for it is written pleasantly..

Mrs. Bishop was an invalid from childhood. She was never other than an invalid while in England. Yet she could accomplish an almost continuous ride of fourteen months, through Tibet, Persia, and Armenia, quite unaccompanied except by native servants; she could explore Manchuria and Korea in the same conditions, to say nothing of several fatiguing tours in civilized parts, such as this country, and the Australian colonies; and wherever she went she could undertake, beside the difficulties of the road, that of writing very full and vivid descriptions of all she saw. In England it wore her out to travel a hundred miles in a first-class railway carriage. One thinks of her lying in a long chair all day, and with difficulty raising a glass of medicine to her lips with a frail hand. But set her down among the Rockies or somewhere "East of Suez," and she became at once a rival of the robustest, most daring men.

Miss Stoddart is sensible of this contradiction, and quotes an article which appeared in the *Edinburgh Medical Review* in 1904, after Mrs. Bishop's death, to explain it. The writer there remarks:

> The invalid at home and the Samson abroad do not form a very usual combination, yet in her case these two ran in tandem for many years. Mrs. Bishop was indeed one of those subjects who are dependent to the last degree upon their environment to bring out their possibilities. It is not a question of dual personality; it is the varied response of a single personality under varied conditions. Of course, the response can only be maintained in an active environment when there is a large storehouse of energy behind it; for no woman can travel some 2,400 miles through a wild and untamed country without having a basis of strength of an unusual kind. . . . When she took the stage as pioneer and traveller, she laughed at fatigue, she was indifferent to the terrors of danger, she was careless of what a day might bring forth in the matter of food; but stepping from the boards into the wings of life she immediately became the invalid, the timorous, delicate, gentle-voiced woman that we associate with the Mrs. Bishop of Edinburgh.

This explanation does not go far enough. It tells us that Mrs. Bishop responded variously to various environments, and hints that excitement had a highly tonic effect on her. But the question is how she, with her poor physical endowment, *could* respond as she did to the environment of Tibet, for instance. Here Miss Stoddart adds some useful information:

> There *was* a great reserve of endurance in Mrs. Bishop, and this was due to her splendid digestion. In spite of the serious ailments which exhausted her constitution, her appetite, and her power of assimilating large quantities of food healthily never failed her. Her husband would rally her on this, and once said laughingly to me, "Isabella has the appetite of a tiger and the digestion of an ostrich." . . . Indeed, she called herself "a savage in the matter of food." . . . This healthy appetite must have strengthened her muscular frame, which made up for her feeble spine.

Add to this really abnormal power of digestion, which was particularly stimulated when she was leading an active outdoor life, a high spirit, great self-control in the presence of danger, an extraordinary resourcefulness when occasion called it out, and we get some kind of solution of the problem.

As for the motives which impelled her to all these wanderings, the search for health was the first. She began travelling for that purpose and it seems always to have played a large part in her excursions. Then, of course, she had a restless and curious nature, and she suffered from loneliness. "I am so thankful," she writes to Mr. Murray, her publisher, from Korea, "for my capacity for being interested. What would my lonely life be without it?" She married her doctor when she was middle-aged, but he lived only five years. The great affection of her life was her love for her sister, Henrietta, who died in 1880. After that loss existence became more or less of a blank for the survivor, which she had to fill up as best she could. "I often told her that she was 'my world,'" she writes; "she was so essential in every respect to my happiness, and things without her have lost nearly all their interest. . . . Oh! I do long so for the father's house and the gathered family and freedom from sin and from the constant effort to grasp the unseen." This was twenty-three years before her own death, and all her really remarkable journeys were accomplished in that interval.

Efficient Democracy. By William H. Allen. New York: Dodd, Mead & Co. $1.50 net.

That social efficiency, rather than personal goodness, should be regarded as the proper test of the reformer, the politician, and the public servant; and that efficiency depends upon knowledge, which is to be gained only by careful investigation and statistical summaries, is the conclusion reached in advance, and argued and illustrated through the three hundred and forty-six pages of this book. The point of view from which Mr. Allen writes is neither that of the public official nor the general citizen; but rather that of the volunteer social reformer. This is indicated in the focussing of the argument upon the need for a volunteer bureau of municipal statistics, and especially in the indication given (page 264) of the writer's conception of the fundamental problem of democracy:

> Democracy's greatest problem is this, how can we utilize without excessive waste the tremendous potential force of the small percentage who, feeling keenly the injustice, the discrepancies, and inefficiencies of government, are willing to make sacrifices, if thus they can help remove discrepancy, inefficiency, and injustice.

What Mr. Allen says concerning the need for publicity, and for knowledge of the right facts for publication is valid and deserves emphasis. A bureau of municipal statistics, an outline plan for which, together with an argument in its favor, is here given, is certainly a needed agency of civic life. That such a bureau, recently incorporated in this city, may demonstrate all that Mr. Allen claims for it is scarcely to be expected, but that it will render valuable service every citizen may hope. No mere fact-collecting agency can, however, of itself alone accomplish much. There must be social dynamics behind all social machinery. The error into which Mr. Allen falls is that illustrated by every special pleader. He not only puts book-keeping and statistics into the first place as a social remedial; but he leaves no place for other factors. Needful as good business methods are, there must be vital forces at work, or every method will fail. Mr. Allen does not consider the great forces which are needful for healthy social life.

As might be expected of the general agent of the Association for Improving the

Condition of the Poor, and the secretary of the committee on physical welfare of school children (which offices he holds and well fills), Mr. Allen considers executive rather than generative methods and measures, and it is only with these problems that he here deals. If this were not the case the title of the book, true to its contents, would have been differently chosen. How to secure an efficient democracy is the problem of those who are thus executively employed. A greater problem, however, is how to secure democratic efficiency—a very different matter. How to utilize the latent power of the inexpert masses, not only in industry, but still more in government, and good government, is the great problem which is still to be met. "Efficient Democracy" is a catchy phrasing of a tendency which is very strong at present. The expert is in demand in charity, reform, and politics, as well as in business. The inexpert mass is crowded back and out. Even the "efficient" contributor displaces largely the millions whose small contributions are not seriously solicited. Will Mr. Allen, or some one, now undertake to tell us how a democratic efficiency is to be secured?

The most serious defect in Mr. Allen's book is, however, still to be mentioned. This is found in the first chapter, on "The Goodness Fallacy," which, briefly stated, argues that it is a false supposition to think a good man will make a capable officer. A very unworthy meaning of goodness is placed in opposition to a somewhat dangerous conception of efficiency. The good man is viewed as one who is only not bad, who has no personal vices; whereas, the truly good man must be efficient in order to be good. The efficient man may be efficiently either good or bad. Mr. Allen is not one who would glorify an efficient villain, and yet he comes very close to falling into this error in his zeal for efficiency. In his efforts to combat a spurious goodness he fails to demand an efficiency which would assure the ends which he has in view.

All in all, however, the book is highly suggestive. Some parts of it are worthy of reading by every type of thinker and worker; other parts will appeal only to the specialized student of the administrative aspects of reform. Its value would have been enhanced for the general reader if it had been condensed into one-third of the present space. Needless repetitions would thus have been avoided, and matter appealing to the interest of only the highly specialized few would have found better place in a separate publication.

Mediæval London, Vol. II, Ecclesiastical. By Sir Walter Besant. New York: The Macmillan Co. $7.50 net.

This volume is the complement of "Mediæval London, Volume I., Historical and Social," reviewed in our columns in August last year. Such a division of the subject into sections is necessarily arbitrary and not altogether convenient. It has not been rigidly observed, as the first section of the present volume, occupying 120 pages, relates to the secular government of London, and therefore belongs of right to the first volume. Parts II. and III., "Ecclesiastical London," and "Religious Houses," fall quite properly under the sub-title.

Sir Walter Besant was not especially an antiquary, nor would he have been content to deal with his subject merely as an antiquary. As an imaginative writer his aim would be to make the past live again for us, as was done by Charles Reade in his immortal book, "The Cloister and the Hearth," or, to take a closer illustration, as was done by Carlyle in his "Past and Present," which brought home to thousands of readers the human interest of Jocelin's twelfth century narrative. Sir Walter Besant's preparation for the gigantic task of making mediæval London real to us was wide and arduous. If he has not largely gone to manuscript records, which could not fairly be required of him, his references show that he was a diligent reader of numerous printed chronicles. But it is impossible to accept the two volumes on mediæval London as what, had he lived longer, would have been the final outcome of his labors. The chapter entitled "The Religious Life" is the only one in the present volume which may, perhaps, be regarded as a finished study. The rest of the volume has the character of mere preliminary notes. Take, for instance, the story of William Fitz Osborn, or Fitz Osbert, popularly known as "William Longbeard," whose career as unprincipled agitator or devoted champion of the rights of the humbler citizens—he is presented in both characters—came to a violent and shameful end on the gallows in 1196. The story is told from one or other point of view by many of the old chroniclers living at or near the time, the longest account being that given by William of Newburgh, who is supposed to have died in 1198. Sir Walter Besant knew the value of contemporary evidence, and is shown by his references to have been well acquainted with these old chronicles. But, while we find here only a few lines about "Longbeard," quoted from Roger of Hovenden, there is a quotation, extending over more than a full page, from Fabyan, who wrote 300 years later.

Nor have Sir Walter Besant's notes been always brought into agreement with one another. On page 214 we are told that "The service [of the Church] was in Latin, a language not comprehended any longer even in Italy; nobody could read; there were no books for them if they could." But later (pages 228 to 230) we find, in a long extract from Tanner's "Notitia Monastica," that young women were taught to read English, and sometimes Latin also; Sir Walter Besant himself tells (page 232) how "the monks set up reading-boxes in their cloisters for those who wished to read."

Again, the most natural explanation of the origin of guilds is that they began as fraternities, analogous to our modern benefit societies, but covering somewhat wider ground. Those of our readers who may chance to have been in Seville during Holy Week, and have seen there the gorgeous processions of the fraternities, can form some idea of the large part played by these institutions in the social life of the middle ages. Trades have a natural tendency to settle, each in a certain zone of a city; this is to some extent found even in the overgrown cities of to-day; much more was it the case in the smaller cities of the past. The centre of the fraternity being the parish church and the parishioners largely of one trade, the extension of the objects of the fraternity to the regulation of trades was a natural transition. This is the view expressed on page 382, but it is not in agreement with passages found elsewhere.

The subject of the book is so wide that it would not have been possible to deal at all adequately with it in a single volume. But one cannot acquiesce in the dismissal of the hospitals of London in two pages, containing no reference to the circumstances under which so many of them were suppressed. And there are many omissions not to be excused on the ground of restricted space. Thus, what is now the Dutch Church was formerly a church of the Austin Friars. At the Reformation it became an important centre of the new teaching by "Zwinglian Gospellers" under John a Lasco, "who," says Heylin, "bringing with him a mixed multitude of Poles and Germans, obtained the privilege of a church for himself and his, distinct in government and forms of worship from the Church of England." This exceptional and very remarkable privilege should surely have been mentioned in any account, however brief, of the church.

It is not an agreeable task to have to criticise so severely a work bearing a name deservedly honored in literature. But, we repeat, it is impossible to regard this volume as a work which Sir Walter Besant would have presented to the public in anything like its present form. It is, however, issued as his work, and this without any reservation. There is no preface explaining the conditions in which the publication takes place. No editor's name is given, and only, we think, in a single footnote is it revealed that the work has had the supervision of an editor.

The book is copiously illustrated, and the illustrations are for the most part good; one, especially, the plan of the Priory of the Holy Trinity and the Church of St. Katherine Cree, is of great value. Some of the others have no obvious relation to the surrounding text.

The Life of Charles A. Dana. By James Harrison Wilson, late Major-General, U. S. V. New York: Harper & Bros. $3 net.

Gen. Wilson became a warm friend of Mr. Dana's during the latter's civilian service in the civil war, and this biography is naturally uncritical. The author had but little unpublished material at his disposal, and of even his published material he has to confess himself not always sure. Thus to many of the extracts made from the *Tribune* during the time when Dana was its managing editor, the statement has to be prefaced: "If Dana did not write this, he must at least have approved of it." This is rather groping work, as is also sometimes the use of matter quoted from the *Sun*. For the rest, Gen. Wilson has loyally paid a debt of friendship, and, leaving his readers to make their own abatements of eulogy and corrections of judgment, has given them the full outlines of a life which was remarkable in more senses than one.

The earlier chapters we think the most interesting. They let us into the shaping of the man. The story of young Dana's struggle for an education, with the unusual attainments which he early reached and added to throughout a long life, is what we like to think typically American. A

haphazard existence for many years, with frequent changes of schools and teachers, yielded experience and discipline to Dana, while they did not slacken his pursuit of knowledge. Slow in finding his work, he was all the while fitting himself for it. His Brook Farm episode is rationally accounted for in Gen. Wilson's pages. Dana had pretty successfully emerged from his transcendental period before joining the transcendentalists. With him, it was a business proposition. He had no means, he had no profession, and Dr. Ripley's proposal that he carry his practical talent and his gift for teaching to Brook Farm was accepted very much in the spirit of a man asked to manage a mill or take charge of a school. When Dana was charged in later life with having turned his back on his Brook Farm principles, we can now see how unfounded was the accusation. At the time, he was in Brook Farm, but not of it.

The book is fullest and most authoritative in the chapters covering Dana's work in the war as a kind of glorified confidential reporter with the army for Stanton, and later as Assistant Secretary of War. Gen. Wilson was personally conversant with most of the matters touched upon, and is able to bring many interesting facts out of the archives. This part of Dana's career was highly creditable to him. With great energy and much sagacity and uncommon literary skill, he wrote to the War Department his impressions of the various generals and the large movements that fell under his eye. That these were of considerable military and political value, cannot be doubted; but their influence in developing Dana's own character, and in directing the remainder of his life, is the greater fact for the reader of this biography.

Dana came out of the war with a fondness for exerting political power, and an itch for office himself, which never left him, and which colored all his subsequent work in journalism. His years of training on the *Tribune* had been of the utmost value to him, unequally yoked as he was with Horace Greeley. But though he took with him to the *Sun* the vigorous pen, the pungent phrase, the power of condensation, there was a pained feeling among too many of his friends that he had left a good part of his moral baggage in the *Tribune* office. In these indiscriminate days, it is hard to understand the indignation and sense of betrayal with which Dana's contemporaries regarded his first going over to sensational and personally vindictive journalism. Some of them still report cynical remarks of his, to the effect that he had gone in for unprofitable reform long enough, and had now set out to make money. Surely, that was not the whole of it; but the effect of his methods on American journalism is something which the philosophic historian of our press will one day have to work out, and which, we fear, cannot be called wholly good. While Dana was still alive, Whitelaw Reid published an article holding him directly responsible for the degradation of New York journalism through its baser exponents — though against the rioting silliness of these, no one, of course, protested more strongly than Mr. Dana. Gen. Wilson seems quite unaware of all these questions, and we can but refer to them here. Privately, the picture which the volume gives of Mr. Dana is attractive. He lived the intellectual life, in the main, was fond of friends and family, had iron health, and joyed in his work. In his calling he was able to awaken the unbounded admiration of associates and subordinates. His biographer has felt called upon to reprint that last vaunting and undignified editorial of his in the *Sun*, all too revealing as it unconsciously was in respect to one who professed to be a man of taste, and to live and die as a cool philosopher.

The Religious Value of the Old Testament in the Light of Modern Knowledge. By Ambrose White Vernon. New York: Thomas Y. Crowell & Co. 90 cents net.

The starting-point of this fresh, breezy essay is that "the great literary power of the Bible will be lost to us, unless its religious power may somehow be retained." The author has evidently been a close student of recent criticism of the Old Testament literature, but his interest is not in the literature as such, or even in the construction of a more truthful history on the basis of critical determinations, but rather in the present religious use of the remarkable series of documents which we call the Old Testament. He recognizes that the employment of this portion of the Bible in the manner of former times has become impossible; and if there has appeared an exhibition of the weaknesses and defects of the traditional use of the Old Testament which is to the same degree fair and sympathetic, and also mercilessly convincing in condemnation, such an exhibition has not passed within our view. It has been set forth frequently that the Church has lost much in the revolution of attitude toward the Bible, but Professor Vernon has made evident in striking manner what the Church has been continually losing through the *continuance* of the old view, and what she still suffers in so far forth as a more worthy and vital appreciation of the Old Testament has failed to obtain. It is plain that criticism has here an enthusiastic advocate. He is convinced not only that critical judgments are in large measure true, but also that failure to recognize their truth has had dwarfing and deadening effects upon the current apprehension of religious truth. His description of the influence of the idea of infallibility in externalizing religion and in begetting a trivial conception of God is outspoken, but fully justified.

In the more positive part of the essay, in which Professor Vernon seeks to establish grounds for high evaluation of the Old Testament in accordance with modern understanding of it, evidences of sympathetic study and religious insight are not lacking. Naturally, he fixes first upon the characters presented in the history as supplying a chief element of its value. The careers of David and Jeremiah are outlined with enthusiasm, in the endeavor to show that the "transcendent service of the Old Testament, in presenting to us personalities that incite profound reverence, is as enduring as virtue, and is utterly independent of changing scientific and philosophical views." A weightier argument, however, in favor of the permanent worth of the Old Testament is brought forward in the next section, where analysis of the influence of Amos, and also of Hosea, in the development of Hebrew faith is made to show how the Old Testament "records the discovery of our fundamental religious truths." The necessity of true appreciation of the writings of Hebrew prophets and psalmists in order to understand the rise of the Christian faith and the career and character of its founder forms the culmination of the author's argument for the permanence and abiding worth of the scriptures of ancient Israel.

Professor Vernon writes with eagerness, with evident sincerity and intensity of conviction, and there is a certain tension and activity in his style, which, while it may not leave his sentences always smooth, keeps one's interest alert. He has gripped the problems of the Old Testament in their broad relations, not as mere literary puzzles and historical perplexities, but as questions quick with interest for the faith of living men. He has shown convincingly the importance of the book for the cultivation of the religious life. Studies of this sort go far to remove from critical research the reproach of dilettanteism, and exhibit the history of religion as an ally of the worthier forces in the spiritual life of to-day.

Science.

Darwinism and the Problems of Life. By Conrad Guenther; translated by Joseph McCabe. New York: E. P. Dutton & Co. $3.50 net.

The treatment of the theory of evolution in this volume is avowedly popular; in fact, no knowledge of science is presupposed in the reader. Whatever the failings of this work, it certainly equals or surpasses in clearness and continuity of interest any similar popular exposition of this great subject which has yet appeared.

Although the author's references are almost wholly to common animals of Germany, yet the text can be applied to conditions in all other temperate countries. The colors, form, and habits of the best-known types of life, from mammals to protozoans, are taken for illustrations of the several phases of the theory of evolution as propounded by Darwin. Following the various phyla, which are considered in separate chapters, comes a discussion of the extensions of evolutionary theories. Germinal selection, orthogenesis, De Vries's mutation theory, and vitalism are expounded in the peculiarly lucid and interesting diction of the author, but all these theories are rejected as unnecessary or false.

It is in thus making a fetich of natural selection, and by its action alone explaining the whole problem of evolution, that the volume falls far short of being a well-balanced thesis. Why the logical reasoning of the organic selection theory is entirely ignored is not clear; especially as an apparent leaning toward orthogenesis on the part of the author would indicate that the omitted theory would perhaps be acceptable to him. Notwithstanding the rejection of all modern extensions of Darwin's views, the

author does not feel himself bound to strict belief in the text of the "Origin of Species," but now and then breaks away radically—a fact to be the more regretted when we remember that the reader, in the person of the unscientific layman, may be led by the excellencies of exposition to a belief in the unquestioned truth of these, at best, tentative subordinate theories. For example, it is far from proved, and is in fact improbable, that the love-dance of the black cock, the strutting of the turkey gobbler and peacock, the song of birds and other "courtship-phenomena," are "connected with the fight of the males, and must be explained as serving to frighten away rivals."

A final chapter entitled "Nature, History, and Ethics" undertakes to put before the reader brief discussions of consciousness, the truth of scientific ideas, the limits of any theory of evolution, and the evolution of the human race. In this latter section we find a severe arraignment of human "inverted selection" as exemplified by war and the transmission of hereditary diseases.

The volume, in short, generally expounds facts and theories of wide acceptance among biologists, and yet never descends to the unfortunate sentimentality which characterizes only too many recent attempts at the popularization of science.

Prof. Angelo Mosso has given his report to the Italian Government on the prehistoric finds he has made in Sicily. His investigations were near Cannatello, not far from Girginti, and here he unearthed neolithic strata at a height hitherto unknown in southern Italy. A complete novelty was a circular, well-paved place, upon which there are five huts, built in part with massive blocks of stone. Equally unprecedented were the neolithic streets, which united the different parts of the locality with this place. The huts are well preserved, and indicate considerable skill on the part of the neolithic builder. The floors show leavings of straw, and remind of similar floors in Troy. The libation tablets here found are similar to those in Crete, and here also a number of votive horns of clay were unearthed. In a tomb in Sant' Angelo Muxaro, Professor Mosso found forty-five well-preserved vases, which evidently belong to the pre-Hellenic period. Of special importance are the Steatite vases, as these prove the intercourse between Crete and Sicily in prehistoric times. All the finds here made are being deposited in the Museum of Palermo.

Professor Heiberg, the Danish philologist, has unearthed a new manuscript of Archimedes at the Convent of the Holy Sepulchre at Constantinople.

The problem of the English sparrow in America is discussed in a résumé of answers to a *questionnaire* sent out by Prof. A. H. Estabrook of Clark University, and published in the *Auk* for April. From this report it appears that the bird exists in vast numbers in all parts of the country east of the Rocky Mountains, except certain parts of Florida, Texas, Oklahoma, and northern Montana, and in Canada north of latitude 50 degrees. The damage done by them is enormous, and scores of reports tell of native birds driven away or killed by these foreigners. In many places a war of extermination is being creditably carried on, but this can be of but little ultimate avail as the vacuum which is thus formed is quickly filled up from the over-stocked surrounding country. In New Zealand a special tax is levied in each county for the purpose of supporting an official whose sole duty is the scientific and thorough killing of young and adult birds, and the destroying of nests and eggs. In Australia the damage done to the crops by this same species of introduced sparrow is now so great that drastic measures are about to be taken. The time will soon come when the increase of noxious insects in our own country, due to the decrease of our most valuable native insectivorous birds, must bring about some concerted action of government and State authority, and then only can we hope for permanent relief. These birds rely for immunity chiefly upon their fearlessness of man, building in cities and towns, and if, by continual and intelligent persecution unhampered by foolish sentimentalism, they can be driven to the woods, it is probable that our native birds of prey—hawks, owls, and shrikes—will easily exterminate them.

Edward John Routh, M.A., D.Sc., LL.D., F.R.S., the famous mathematical coach and "senior wrangler maker," has died at his home in Cambridge, England. He was born in Quebec on January 20, 1831, and was the son of Commissary-General Sir Randolph Routh, K.C.B. At the age of eleven he was taken to England, where, at University College School and University College, he gave evidence of remarkable talent for mathematics. He entered Peterhouse College, Cambridge, in 1851, studying under Todhunter and Hopkins, and was senior wrangler and Smith's prize man of his year, 1854. As senior wrangler he was said to rank as high above the second wrangler as the latter ranked above the last man in the tripos. He was for many years a lecturer in his chosen subject at Peterhouse and Pembroke College, and was six times examiner in the mathematical tripos of Cambridge University. He was a fellow of the University of London, a governor of Dulwich College, a member of the council of the Royal Society, the Royal Mathematical Society, a member of the Cambridge and of the Royal Geographical Societies, and a founder of the London Mathematical Society. His greatest success, however, came to him in connection with his private teaching. From 1857 to 1888—covering thirty-one years, in all, of his teaching career—he coached nearly seven hundred young men through the mathematical tripos, and of these more than five hundred took rank as wranglers. In addition to these twenty-seven senior wranglers, more than forty of his pupils were Smith's prize men. He wrote many papers on mathematical topics, and several important books. Among these are treatises on "Rigid Dynamics," "Statics," "Stability of Motion," and "Dynamics of a Particle."

A cable dispatch from London announces the death of Prof. Alfred Newton, M.A., F.R.S. of Cambridge University, who was born of English parents in Geneva, Switzerland, in 1829. He took an active part in all legislation for the protection of birds, and brought the subject for the first time before the British Association in 1868. He was at one time vice-president of the Royal Society and had served the Zoölogical Society many times in the same capacity. He was president of the Cambridge Philosophical Society, and the recipient of the gold medal of the Linnæan Society, and of one of the medals of the Royal Society. Among his books may be mentioned "The Zoölogy of Europe" (1862), "The birds of Greenland" (1875), "A Dictionary of Birds" (1893-96), and "Ootheca Wolleyana" (1864-1905).

Drama and Music.

Christopher St. John's "Ellen Terry" is the first of a proposed series on "Stars of the Stage" to be edited by J. T. Grein and published at the Bodley Head. Mr. St. John's essay is pleasantly written and fairly accurate, as far as it goes, but is incomplete as biography, and is too evidently the work of a fervent admirer to have much value as criticism. It is, however, free from the silly rhapsodical gush which is the stock in trade of the ordinary theatrical scribbler. He does no more than justice to Miss Terry's personal charm and exquisite skill in the higher comedy, but greatly overestimates her tragic powers, whose limitations are abrupt and definite. He does not attempt to justify his faith by analysis or description, and apparently lacks the experience which might have afforded him useful standards of comparison. Of his facts, not one is new, while many are absurdly trivial, but the chronological list which he furnishes of Miss Terry's characters will be useful for reference. The most promising of the volumes underlined for speedy production is one by G. K. Chesterton on Bernard Shaw.

It is not often that a theatrical incident of so much public interest as the return to the American stage of Miss Julia Marlowe and Mr. E. H. Sothern happens so late in the season. They began their two weeks' engagement here in the Academy of Music on Monday evening. They deserve well of the community for the creditable manner in which they have been upholding the credit of the American stage in England. The substantiality of their artistic success upon the London stage cannot be altogether obscured even by the indiscretions of a ridiculous press agent. Current reports that their expedition did not result in a great financial triumph are probably founded on fact, but it is certain that their interpretations, with a few exceptions, secured the warm commendation of competent critics. Moreover, it was generally admitted that, in the course of a few weeks they offered a dramatic programme which in respect of variety, range, and general excellence, could not, in these later days, have been excelled in any London theatre. The knowledge of this fact only adds to the regret that so promising an artistic partnership should be dissolved so abruptly.

Word comes from London that the play selected for John Drew next season by Charles Frohman is "My Wife," an Anglicized version of "Josette, Ma Femme," which has had a long run in Paris. The English piece is by Michael Morton, and

has just been produced at the London Haymarket. It consists for the most part of "commonplace, purely external fun—'comic' parents, 'comic' hotel guests, 'comic' supper parties, and other 'comic' causes for yawning."

H. A. Jones's new piece, "The Galilean," which is to be produced in New York, under the author's personal supervision, in the early autumn, although not devoid of comedy, is said to represent the author in his most serious and strenuous mood. It belongs to the same category as "Judah" and "Mrs. Dane's Defence." The hero is a preacher of the primitive Gospel, who, going to the Scriptures for his inspiration, finds himself in conflict with all the creeds.

There seems to be a good deal of truthful satire and of a superior quality of wit in "George Paston's" comedy "Clothes and the Woman," which has just been acted in London by the Pioneers, with Miss Matthison as the heroine. The argument is that men are too apt to judge women by their clothes, instead of by their true selves, and the intrigue revolves upon a misunderstanding of this sort.

George Ade is at work upon a new play for William H. Crane. It will be tried first in Chicago, in October.

Still another Wagner biography is in course of publication. It is by Max Koch, professor of German literature at the University of Breslau. The first volume, recently issued, though a large one, takes the story of Wagner's life only as far as the eve before the first performance of "Rienzi." Two more volumes, at least, will be required to complete the task on this scale. Another recent Wagner book is by Paul Moss, and is entitled "Richard Wagner als Aesthetiker."

The German Emperor is fond of military marches, as played by his bands. Two years ago it occurred to him that it would be well if some of the best of these marches were arranged for the voice, and Ferdinand Hummel was entrusted with the task. Breitkopf & Härtel now issue a collection of eighteen of these marches, in four versions: (1) for soldiers' chorus; (2) for male choral societies; (3) for schools; (4) for pianoforte. Appropriate texts have been added, and the volumes are sold at a low price.

A London critic considers Rosenthal's opinion that Chopin is superior in harmony to Beethoven "very strange"—an amusing instance of the Beetbovenolatry prevalent in the musical world. Beethoven is not superior to all other masters in all things. In harmony he is certainly inferior to a dozen of the masters. Dr. Scbucht, in his admirable little book on Chopin (Leipzig: C. F. Kahnt), says that in the very first of Chopin works, the Rondo in C minor, there is a freedom of modulation seldom found in any of Beethoven's works; and in his later composition Chopin laid the foundation for the chromaticism of the later Wagner. Wagner himself realized that harmony was not one of Beethoven's strong points. "It has been very justly remarked," he wrote, "that Beethoven's innovations belong more in the realm of rhythmic arrangement than in that of harmonic modulation."

Weingartner has been devoting much of bis time in recent years to writing chamber music. His opus 33 is a sextet; his opus 40 a quintet; his opus 42 two sonatas for violin and piano.

Art.

THE SALONS.

PARIS, May, 1907.

"That mediocrity has always dominated the Salon is indisputable; hut that it now prevails more than ever, that it has become absolutely triumphant and overpowering, is as true as it is distressing": so Baudelaire wrote in 1859, though his criticism sounds as if it could come only from the unfortunate critic compelled to make the rounds of this year's two hig exhibitions in the Grand Palais. The fact is that disappointment in the quality of the Salons, considered the most important shows of the year, is hy no means the new thing we arc inclined to think it. Genius has always been rare, mediocrity has always flourished. The only difference is that when Baudelaire wrote there were some young Frenchmen doing good and individual work, though the Salon found next to no place for it, and there was merely one, instead of two, cruelly huge exhibitions. Besides, the distinction with which the Société Nationale des Beaux-Arts began its career in 1890 has made disappointment all the keener to-day, when little separates the exhibitions of the old and the new society except the turnstiles between them. An artistic period may never have been, but there is no question that art has seen its barren periods, and few more hopelessly so in France than the present.

However, even in the Salon of 1859, Baudelaire found work by two men to interest bim: Legros, then unknown, and Amand Gautier, now forgotten. So, for me, in this year's Salons, the dulness has been relieved by the work of two distinct groups, less for its actual merit than for the promise given. These two groups are formed mostly of younger men whose names are still to make. The older men, for whom fame or notoriety was long since won, seem so fearful of losing it, that year after year they repeat themselves, reducing to a formula methods that once were fresb and original.

Tbe standard is, of course, higher than in London, tbe accomplishment more complete. French painters and sculptors and engravers are trained to be workmen, to whom mastery of their medium is indispensable before they venture upon flights of imagination or orgies of sentiment. The picture by a British artist which may have struck you as above the average in London, simply disappears in Paris, unable to stand tbe test of comparison. More than this, there are canvases by some of the Frenchmen that reach a higher level tban usual. In the one Salon, you may admire the originality of Simon in his latest portrait group, as in the other you cannot refuse your respect for the seriousness with which Jean Paul Laurens has carried out his latest academic exercise. But even so, taking the exhibitions as a whole, I feel in Paris very much as Kenyon Cox felt in Pittsburgh, the present commonplace or weakness or worse of French work, and this not only in painting, but in sculpture, and more particularly in etching and lithography, in which, only a few years ago, extraordinary and stimulating things were being done, and suggestive experiments made. It is the more depressing because the Moreau-Nélaton collection, now on view at the Musée des Arts Décoratifs, reminds one of the great work French artists were doing, the great promise they were giving, at very much the same time that Baudelaire wrote with such despondence.

But if there exists something like listlessness or anæmia among the French who are so accomplished technically, the artists of two other nationalities show signs of vigor. I had not been long in the old Salon before it occurred to me that whenever a picture attracted my attention, it was sure to be either by a Spaniard or an American, and the further I went, not only in the old but in the new Salon, the more I was confirmed in this impression. The work might sometimes he not very distinguished, it might be coarse, it might be commonplaceness itself in motive. But there was an unmistakable character in it, a personality, if that can be personal which several share. I cannot say that the Spaniards, as a rule, reveal the qualities which are most admirable in an artist. They are all too deeply influenced by Zuloaga—or by his success—and his is not the sanest influence. He is absent (as is also Anglada) this year, but on every side you are confronted by his bull-fighters, his Spanish women in shawl and lace mantilla, his groupings, bis poses, his movement, his manner of placing his figures against a landscape background. It is a trifle tiresome, to be honest, Zuloaga having already done the thing too often. But, certainly, his disciples do it vigorously and with apparent zest—in the case of Vasquez, with a swagger hardly less than his. But if there is small originality in the selection of subject, if there is a tendency to brutality alike in conception and execution, the work is the work of men who are very much alive, and their energy is bracing in the midst of the prevailing indifference and languor. It appeals to you in the sculpture court as in the picture galleries. The one big piece of sculpture in the old Salon that I remember with any vividness is a group of Marcken women by Bilbao-y-Martinez. If much of the Spaniards' energy is misdirected to-day, it has but to be turned into new channels, and Spain might at last produce a school of artists not unworthy of the country of Velasquez.

With the Americans, I think there is a great deal more than energy—qualities without which energy is of little value. It is extraordinary how they are developing a style of their own, very much as America has developed a style of its own. In the streets of London, you recognize an American woman at a glance; on the walls of the Salon, you can seldom mistake the American picture—and I am speaking not of the old exhibitors, long *hors concours*, hut of newcomers, many of whose names I never remember to have heard before. One reason, of course, is that tbe American naturally sees the national type in his model or sitter, just as the Frenchman or Spaniard will. But this is by no means the only reason. Grad-

ually, you begin to note that the American painter is evolving a distinct technique: I hardly know how to describe his painting, unless I say it is "slick," a term artists, anyway, will understand. And, besides this, they have trained their eyes to see beauty in line and harmony in composition—they have, above all, a sense of arrangement. Let me take an example to explain. In the big room of the old Salon there is a very large study of the sand dunes in the Pas de Calais, by Hughes Stanton, an Englishman, and the picture has been bought by the State for the Luxembourg. It is extremely careful, but photographic in its arrangement—or want of arrangement; the painter has apparently camped out conscientiously before his subject, and put down everything just as it is in nature, without any endeavor to select or reject, or to bring lines and masses into a well-balanced design. The result is about as interesting as a photograph. In another room, in an inconspicuous place on the walls, passed over by the authorities who buy for the Luxembourg, is a small picture of a similar subject—Dans les Dunes—by Charles Warren Eaton. It is not a remarkable landscape, but it is the work of an artist, not of a human camera, and is composed with a delicate feeling for line and pattern. There has been rejection of the unessential, selection of the material, with which art should be concerned, and the result is far truer of nature than Mr. Stanton's chaotic record of facts—and has, moreover, genuine pictorial charm. And this pictorial charm, or the deliberate seeking for it, is characteristic of the work of almost all the younger Americans who now exhibit in Paris. At the new Salon, Mr. Sargent does not appear, it is long since Mr. Alexander and Mr. Humphreys-Johnston have contributed. Walter Gay does show—again several delicate and dainty little interiors. But I am now referring, more especially to such work as Myron Barlow's, so simple in its harmony of color, so broad in treatment, so rhythmical in line; and Mr. Frieseke's, with its decorative grace; and I think I might almost include Mr. Morrice, though he is a Canadian, for in his landscapes he is preoccupied with the same problems and qualities. In the old Salon, Richard Miller, Chauncey F. Ryder, McLane Johansen, Miss Martha Baker, Frederick Sutton, all interested me, because, though not equally successful, they all seemed striving after beauty of arrangement and distinction of style. It may be that this growing sense of line and pattern among the Americans comes from the influence of Whistler. There are not so many slavish imitations of him as there have been in previous Salons. It is rather as if Americans were beginning to realize that his was the right attitude towards nature—that the artist's business is to pick and to choose the elements which nature provides with foolish prodigality.

When there are Americans doing fine work and showing intelligent appreciation of the real aims and ends of art, it is, to say the least, disheartening to find Mr. Roosevelt sitting to a painter entirely outside this new movement in the right direction. It is all very well for Queen Alexandra to allow herself to be painted by Madame Cécile de Wentworth; the present royal family of England have always preferred the feeble and the pretty. But we expect other things from the President of the United States. Madame de Wentworth figures as the pupil of Cahanel and Detaille. But there is little evidence of her having studied under any one in her portrait of Mr. Roosevelt—the head without character, the figure without modelling, the background without perspective, the work without the distinction one is now justified in looking for from the American painter.

To judge from the Salons, the immediate future of art rests with the Americans and the Spaniards. But the French, if it is a moment of decadence or indifference with their artists, have not lost that genius for order of which you are conscious in their poplared roads and fields, in the Haussmanized streets of their capital, as in their literature and art. No great pictures may be painted by them just now but, as in the Moreau-Nélaton collection you are reminded of what their artistis were accomplishing not so many years ago, so in the arrangement of the Musée des Arts Décoratifs, you gladly admit the perfection with which they can now group and classify, and exhibit the decorative work of different nations and periods. Indeed, the effectiveness in one of the galleries of a great panel by Besnaud, which I thought empty and superficial in the Salon, has made me wonder whether, after all, many works now seeming so dull at the Grand Palais will be transfigured into masterpieces when removed to the places for which they were designed. Certainly, in two or three new rooms opened this year on the lower floor of the old Salon, much may be learned of the gain to paintings by intelligent hanging. These rooms are reserved for half a dozen or so huge panels. Two by Henri Martin—one of a shepherd and sheep on the banks of a stream in the quiet evening light, another of laborers in the fields in brilliant sunshine—depend for their charm not merely upon an appropriate setting; they would be charming anywhere. But the other panels, if hung in the crowded room of big machines upstairs, would be passed without a second glance. And yet, they borrow distinction from their surroundings, and tell on the well-spaced walls of the long cool gallery where the sunlight falls softly through the tall white-curtained windows. One day, it is to be hoped, the hanging committee will carry out as wise an arrangement in all the galleries of paintings. As it is, the pictures in the old Salon are still badly hung, though no pains is spared in displaying the decorative work. There are few large exhibitions, if any, where the trouble would be taken, as it is here, to show stained glass in the one way in which it should be shown, that is, let into a window, with the daylight shining through it.

The care devoted to some things makes the carelessness with which others are exhibited the more irritating. Nothing is more disappointing in the two Salons than the exhibition of Bracquemond's life work in the new Salon—where, as a rule, there is so much less crowding on the walls. But in all that enormous building, only one room could be spared to Bracquemond and his paintings, prints, drawings, plates, are so huddled together, reaching almost to the high ceiling, that you come away with your impression of his accomplishment lessened, asking yourself why he should heretofore have seemed so distinguished a member of one of the most distinguished groups of artists who ever heralded a new movement in France. But it is the arrangement that is to blame, as a pastel here, a series of plates there, that refuse to be overshadowed, will convince you.

N. N.

"The Life and Work of Auguste Rodin," by Frederick Lawton (Scribners), is at once a eulogy, an apology, an interpretation, and a minute biography without being really effective except on the last count. Mr. Lawton has evidently kept his scrapbooks faithfully. Nothing that has befallen or has merely been said about the great sculptor has escaped his vigilance. In particular he has run down many works of Rodin's prentice days which, if of rather slight importance, still deserved recording. The personal record is singularly complete, even to Rodin's admiration for the Javanese dancers, and the daily ineffectual visits of his barber. The Boswellian part of the book suffers like the rest from defects in taste and literary shortcomings, but is decidedly interesting. As an interviewer, Mr. Lawton has not the gifts of his predecessor, Mlle. Cladel, but he has an eye for his hero, and a knack of making him seem very real. Rodin's talk as filtered through his biographer's notebooks brings welcome confirmation of the geometrical, almost academic, principles of composition that underlie the sometimes disquieting naturalism of the conception and modelling. In everything that involves the sculptor's personality, his struggles, the controversies that have so often raged about his work, Mr. Lawton is an excellent if naturally biassed guide. On the critical side the book is weak. We find, for example, no sufficient expression of Rodin's well-known theory of correspondences. Without realizing the sculptor's sense of the continuity of his works with all natural appearances, one cannot understand the strong element of symholism that ennobles his apparent realism. In this regard a few pages of Gustave Geffroy or of Arthur Symons are worth this stout volume. Since Rodin's work is the most characteristic and significant production of our times in any art, this minute and fully illustrated record will retain a certain value despite its heavyhandedness. But to read about a highly subtile art in such English as is here vouchsafed, is like drinking a rare vintage in a blackjack. One cannot fail to get the pucker in such a sentence as the following, on the exhibition of 1900: "The bulk of the subjects were those that mingled the sexes, and in them the gamut of emotion was touched throughout its compass." Constant outcroppings of this stamp give one a complete distrust of Mr. Lawton's appreciations, even where one is thankful for his observations. To the lists should be added the splendid headless bronze from the sketch model for John the Baptist which has been loaned to the Metropolitan Museum by Mrs. Simpson.

The Prix Jean Reynaud at the Académie

des Beaux-Arts has been awarded to the series of *cartons* made by the late M. Toudouze for the Gobelins tapestry designed for the Cour d'Appel at Rennes.

Finance.

FINANCIAL DISTRESS IN PROSPEROUS TIMES.

Probably most people who read, Tuesday morning, the news that the $5,500,000 steel trade house of Milliken Brothers had failed, were at a loss to understand it. Failures in actual panic times, such as 1893, are taken for granted; the cause then is the inability of business men on a company's books to pay their debts, or the suspension of banks where the company keeps its balances. Failures due to speculation or defalcation may happen at any time, and failures may occur, even in prosperous trade conditions, because of a sudden fall in prices for the commodities dealt in by a company, or because of what the markets call "dry rot"—the drifting away of business to competitors. The case in point, however, occurs in a business boom. Nothing in the way of what are called "financial irregularities" is stated as connected with it. Prices of the commodities sold by the company have not declined, and as for "dry rot," the first statement made by the assignee was that contracts and orders on the books of the concern had for volume never been paralleled in its history. On the face of things, these specifications would seem to prove a profitable industry and absolute financial soundness.

Yet the failure in question arose from causes so very much on the surface of things that Wall Street had been talking of them, to the exclusion of almost every other consideration, for six months past. When Secretary Shaw said, last December, that "we who pray should ask God to save us from any increased prosperity—we have all that we can stand," he was not giving utterance to a foolish paradox, but was expressing in homely language a very real dilemma of American industry, to which such men as James J. Hill had already directed serious discussion. The problem was, how to provide the facilities for the enormous and rapid expansion of trade, when the cost of providing them was increasing by leaps and bounds, and when the supply of available capital had a necessary limit. That this has been a vital problem with the railways, their bids for nearly $300,000,000 on short-term notes, in a most disadvantageous money market, are clear enough proof. But manufacturing and contracting companies have been confronted with precisely the same problem as transportation companies. With the firm of Milliken Brothers, pressure of orders led to construction of an extensive new steel-making plant, and of this their assignee remarked:

> The estimates for the completion of this steel plant were as usual exceeded, and in fact, exhausted the working capital. This was in part supplied by the individual resources of its principal stockholders, but still remained inadequate. . . . The assets comprise a plant, which, with the real estate, machinery, and plant, is valued at $7,250,000, and merchandise and supplies on hand of the value of about $750,000 more. About three-quarters of one million is invested in construction under outstanding contracts.

It is necessary only to add that companies and individuals in much stronger position were besieging the banks for accommodation at high rates, and that the requests of the steel manufacturers for the money which they needed could not be provided for. Confession of insolvency then became inevitable.

It will at once occur to mind that a series of similar disasters overtook numerous industrial companies in 1903, and for somewhat similar causes. The Consolidated Lake Superior Company, a steel-making corporation, with a capital stock of $100,000,000, which had paid a 7 per cent. annual dividend on its $35,000,000 preferred shares up to the autumn of 1902, went into bankruptcy the next year through inability to borrow $5,000,000. Other large manufacturing companies, which had been paying handsome dividends, reduced or stopped such payments, and in some cases put a cash assessment on their shareholders, in order to raise working capital. Such companies learned then that it was neither a safe nor an easy way of doing business to trust to banks and the open money market for capital needed to conduct a corporation's trade. Necessarily, this principle applied all the more forcibly when the capital thus used was not, as with the proceeds of a dry goods merchant's discounted notes, "turned over" in a season, but was "tied up" in contracts often extending, like those for the Pennsylvania Railway's New York terminals, over a series of years. The billion-dollar Steel Corporation itself learned a lesson by some bitter experiences in the money market of 1903, and has since then pursued the policy of using the bulk of its huge earnings for improvements, extensions, and new construction, even when such policy necessitated the holding down of dividends, instead of paying them out with the reckless profusion of its earlier history.

It is probable that the hard knocks sustained by the industrial companies in 1903 are the chief reason for their generally much sounder position now. This may in part explain why trade activity and prices of products have not given way in the present tight money market as they did four years ago, and it undoubtedly explains why the Milliken insolvency has not frightened the financial community on the assumption that it points to a condition generally prevalent. Nevertheless, it is open to question whether a slackening in volume of trade, and in many directions a lowering of prices, will not turn out to be the only sure line of safety for industry itself. It is plain enough to the wayfaring man where the consumer suffers, when the prices for rent and household necessaries have gone up faster than his income. It is not always so obvious that the manufacturer may suffer in the same way, when the price of labor, capital, and materials has risen faster than the price of his finished goods.

In "Our New Internationalism" (D. Appleton & Co.) Mr. Harold Bolce makes a plea for commercial reciprocity. He has discovered that modern industry and commerce are tending to become international in scope and organization, and that protective tariffs in almost all civilized countries now obstruct the further growth of economic internationalism. For the political economists who long ago proclaimed this truth to the world he has nothing but the utmost contempt, having preferred to discover the fact for himself; but one need not quarrel with him on this account, since it is enough that he has groped his way, however blindly, into the light. Mr. Bolce has travelled extensively in Europe and other benighted districts of the world, and has made the further discovery that there are civilized people outside of the United States whose trade is worth having and with whom it would be well to enjoy freer commercial intercourse. He explains in simple yet forceful language, which should be intelligible even to the "standpatters," that the Dingley tariff is not "the result of plenary economic inspiration," that our policy of commercial exclusion has injured important American interests, and that it is likely to

Financial.

Convertible Bonds

In the third edition of our 6-page circular, entitled "Convertible Bonds," we describe practically all of such investments now upon the market. In addition, we explain why such bonds, when properly selected, are well regarded by conservative investors, and also why they possess every probability of returning exceptionally large profits.

Properly selected investments are based upon safety and income yield combined; in other words, minimum risk of principal and maximum income return.

cause further injury unless we hasten to come to an understanding with Germany and other countries that have followed in her steps. He shows that "to stay put, to stand pat, and to stick in the mud, may all be the result of similar inertia"; and that inertia is something in which a commercial nation in the twentieth century cannot safely indulge. We could wish that he had not called his German porter a "packtragger" (p. 111), and wonder where and how he learned that "more than half a billion annually leaves this country for investment by Americans in the stocks and bonds of Europe"; but we are not inclined to be captious about small things. In his campaign against the "standpatter" we cannot do less than bid Mr. Bolce God-speed.

Interest in the subject of life insurance does not seem to be upon the wane if the production of books treating of that subject may be taken as a criterion. T. E. Young's "Insurance: A Practical Exposition for the Student and Business Man" (Isaac Pitman & Sons) deals with the theory of insurance in all its branches, but most of the chapters are concerned particularly with life insurance. Though written primarily for English readers, it has interest for American students of the subject; but it does not pretend to be a book for experts. If it can lay claim to no striking merits, the volume is also free from striking defects.

ALICE-FOR-SHORT

By WILLIAM De MORGAN

575 pp. $1.75

" 'Joseph Vance,' with its full-blooded people, its unabashed sentiment, its life-like inconsecutiveness, its endless delightful talky-talky, won back for us fathers and grandfathers of to-day the dear atmosphere of that world of fiction in which we were reared. . . . This is Dickens, that is Thackeray, yonder is a hint of the Du Maurier stepping-tone. . . . There is no manner of doubt as to the school to which this new-old craftsman belongs; the important fact is that he belongs to it, and does not merely hang upon its heels. 'Alice-for-short' is sure to retain for its author the friends which 'Joseph Vance' made for him. . . . The plot of this second book is much more elaborate than that of the first."

The Evening Sun says: "This very, very good story. The more carefully you read 'Alice' the better you will like it."

NEW YORK, THURSDAY, JUNE 20, 1907.

The Week.

Gov. Hughes's veto of the two-cent fare bill is a truly remarkable document. Not since Grover Cleveland's time have we had such a brave example of readiness to defy popular clamor as the Governor has given us in his refusal to approve the bill giving equal pay to men and women school teachers in this city, and this two-cent fare measure. In March, 1883, Mr. Cleveland killed the bill reducing the fare on the elevated roads from ten to five cents. Public feeling ran nearly as high against Jay Gould and Cyrus Field at that time as it has of late against the managers of our railroads. The Legislature's action was due, in part, to this public excitement, and was as little the result of a careful investigation of the actual facts in the case as is this Legislature's desire for two-cent fares. It was not thought that Mr. Cleveland would dare to veto the bill, but he braved public disapproval only to find himself a national figure. But not even Mr. Cleveland could give such admirable statements of his reasons as can Mr. Hughes. This last veto, in particular, deserves and will receive a permanent place among the important papers of this State by reason of its lucidity, its convincing arguments, its indisputable proof that the writer possesses not only remarkable reasoning powers, but a complete mastery of his subject. A Governor less strict with himself and more desirous of an easily-secured party advantage would have given us a lengthy discourse on good and bad railroads; might have admitted some resulting hardship for certain corporations; would have referred to the public demand for the strict regulation of delinquent corporations, and then have quietly signed the bill. It is fortunate for the whole country that at this moment of popular misconception as to what constitutes real statesmanship, there is a man at Albany who can show just what high political thinking really is, and can reenforce it with courage and backbone in action.

The experience of Wisconsin confirms in a striking way the points made by Mr. Hughes in his veto message on the Baldwin bill. In each State there was an element which desired to join in the general two-cent fare movement, arbitrarily fixing that mileage rate as about right, without any too careful inquiry as to what a perfectly just charge would be. The Governor of New York insisted that the new Public Utilities Commission, which exists for that very purpose, should investigate the subject and fix whatever rate of passenger fare might be just. In Wisconsin the course of events was reversed. The State Railroad Commission, before the Legislature even met, had investigated the question of passenger fares, had concluded that two cents a mile was an unreasonably low rate, and fixed the maximum for the State at two and one-half cents. In spite of the popularity of the two-cent rate, the State Senate now accepts the decision and abandons the idea of fixing rates by direct action. The result shows that there is no method so effective for quieting violent and unreasonable sentiment against the public service corporations as a demonstration that the constituted authorities are dealing with them and the public in a spirit of fairness and fidelity.

Are we back under a benighted and unpatriotic Democratic Administration, that men who actually enlisted for the civil war are having their applications for pensions rejected merely because they do not deserve them? To be sure, the Pension Bureau attempts some sort of explanation of its reasons for turning away certain veterans. It is fair and right, says the Bureau, in effect, to provide for the old age of the man who enlisted in good faith, but whom circumstances kept from the front. But, it points out, here were men who could have seen fighting, but would not. Some of them enlisted for three months, and, when it was seen that three-months men were of no use, went home on furloughs and refused to reënlist when the need for soldiers was most urgent; some were technically mustered into the service and out again substantially on the same day, and some were Confederate prisoners who enlisted on the condition that they should not be made to fight against their former comrades. This is all very well. It might convince a judge or a plain citizen. But we want to hear from the G. A. R. organs.

Of the new régime of the New York Life Insurance Company, which began on Monday, it is to be said, first, that it undoubtedly represents the wishes of the vast majority of the policyholders. Making every abatement for claims that the men in opposition can reasonably set up, the fact remains that the administration ticket was overwhelmingly endorsed by those who have most at stake in the company. This, it seems to us, entitles the new board of trustees and the new president to the most considerate treatment by the press and the public. It was understood from the first that Mr. Orr took the presidency only as a stop-gap, and until his successor could be chosen by a board elected under the new insurance law. This has now been done; and Darwin Pearl Kingsley, the elected president, announces his programme to be that of cheerful acceptance of the recent statutes governing the business of life insurance, though he rather needlessly remarks that he thinks the limit put upon the amount of insurance that can be written is economically unsound; and promises the most rigid economy and integrity of management. It is only proper that he and his fellow-administrators be now given a fair field to show what they can do. They are perfectly aware of the terrible blow which their institution received in the investigation by the Legislature, and know what must be done to repair the damage and regain public confidence. So long as they devote themselves to that work, they are, in our opinion, deserving of public support.

Plans for beautifying Chicago are well under way. More than $32,000 has been raised by the Commercial Club towards the expenses of Daniel H. Burnham, the architect-in-charge, who has generously given his services since October last. Mr. Burnham hopes to evolve a clearly defined scheme which will "permit unhampered growth within the city proper, and the development of the city beyond," and also result in establishing great circuit boulevards, from which the traffic will be distributed to every section of the city. Meanwhile, three committees of the Commercial Club have been hard at work—a Lake Front Committee, a Railway Terminals Committee, and a North and South Boulevard Connection Committee. The Lake Front Committee speedily discovered that an immense public improvement was possible at a slight cost. The purpose is to build a narrow park strip on the mainland and a broad one out in the lake, leaving an open lagoon between the two, to be diversified with islands, while the shores are to be planted with trees, shrubs, and flowers. The committee recommended that a law be sought from the Legislature enabling the South Park Board to acquire the riparian rights of shore owners. Such a law was finally passed and signed by the Governor on May 2.

Japanese may well take a certain satisfaction in the conviction of Mayor Schmitz of San Francisco. He was the great champion of the higher races on the Pacific Coast, and the man who bore its demands, as against the Japanese, to

BURLINGAME PUBLIC

President Roosevelt. Now it appears, by legal evidence, what was long known with moral certainty, that this man who was received at the White House as a negotiator in affairs of international moment, was all the while nothing but a vulgar grafter. His anti-Japanese heroics were not even a decent mask for his criminal activities. While shouting about saving San Francisco from immoral foreigners, he was prostituting his office, violating the Penal Code, and pillaging the municipality. Now that he is caught, we can all see that his stealings were as incautious as they were unscrupulous, and that it was the easiest thing in the world for a skilled prosecutor to trap him. His power was built up in about equal proportions on race prejudice, labor-union tyranny and corruption, the greed of corporations, and the supineness of the citizens. He could have been ousted or jailed long ago if San Francisco had really wished to do it. Now that he has been exposed and convicted in court, the city should wake up to the need of having a new deal all round; not simply washing its hands of the shameful Schmitz, but getting rid of his whole crew, and setting up a municipal government fit to cope with the great emergency and to reassure the rest of the country.

It is safe to say that, if the President had had before him last autumn the results of the Senate Committee's investigation of the Brownsville shooting, he would not have taken the hasty action which made that case famous. This is not to imply that he will now change his opinion, or retrace his official course. Consistency is the hobgoblin not only of small minds; it is also of men in great office. The Senate report will not come formally before the War Department and Mr. Roosevelt for some months yet, and, meanwhile, nothing will be done for the summarily discharged troopers. But the inquiry has undoubtedly done much to enlighten and to change public opinion. The colored soldiers have not been proved innocent, but no individual among them has been shown to be guilty. All their white officers now testify that they do not believe the men did the shooting. This is a marked reversal of judgment in some cases, especially that of the commanding officer, Major Penrose. There are, of course, many mysterious things about the Brownsville affray which the conflicting evidence has not settled. Perhaps they never will be all cleared up.

The unwritten law has again been heard from in the South. It has just been laid down in two cases that it applies to women murderers as well as to men, and to negroes as well as to women. Thus a white jury in the Richland, S. C., County Court has freed a negro who killed his wife and a negro with whom she had guilty relations. The murderer admitted the crime. The only defence was the unwritten law. Against this the judge, Charles G. Dantzler by name, nobly threw his whole weight. He formally charged the jury that there was "no law higher than the written law." But the jury was unanimous for acquittal. The South Carolina press has applauded the judge's stand, notably the Columbia *State*, which contrasts his action with that of Judge Harrison in the Strother case, and adds that Judge Dantzler's words "are in complete harmony with the practice of the judges generally in South Carolina," whose "utterances from the bench rarely, if ever, include any let-down in the dignity of the law or compromise the respect in which it should be held by the people." The other case is one in Mississippi, where a woman killed a man who was alleged to have wronged her. Judge and jury both did their duty, and the woman was sentenced to prison. The Supreme Court stood firm. It is the notorious Governor of the State, Vardaman, who is to undo their steadfastness and weaken the force of the written statutes by setting the woman free.

The Chicago *Tribune*, which has long specialized in the collection of crime and casualty statistics, announced this week that in less than six months of the present year the total casualty record of the entire year 1906 had been surpassed. With 273 deaths already and 925 injuries in railway accidents, 902 lives lost in steamship and 355 in mine accidents, 2,240 persons killed by tidal waves, 5,100 by earthquakes, and 530 by hurricanes, "there can be little doubt," the paper says, "that 1907 will be known in history as the year of disaster." This unenviable preëminence would apparently be secure even if the misplaced switch, the misunderstood signal, the careless pilot, the atmospheric vortex, and all their allies should go out of business from now till December 31. But the same authority reports for 1907 a larger total of philanthropic gifts and bequests, with a smaller total of embezzlements and other defalcations, than for any corresponding period in twenty-five years. Thus the apparent visitations of the last year come at a time when the human race has been behaving particularly well in respect to both benevolence and honesty. The facts might puzzle a believer in special providences.

Of our forests might fairly be made the cynical observation often repeated about children—that those who have them know least about bringing them up. The Trans-Mississippi Congress, which meets this week, is viewed by Administration eyes as merely an attempt to put the Government "in a hole" in respect to its forestry policy. Yet the men held responsible for such an attempt are precisely those from forest States. If there is one policy upon which all disinterested authorities are agreed it is that of conservative and restricted use of our remaining timber supply. Yet many men, apparently in the best position for understanding the whole policy, oppose it with all the fervor which they could put into a moral issue, as if the President were ruthlessly staking out some American New Forest for his own private bear-hunts. There is no sign that they are converted; but they certainly have converted no one outside of their own section or their own interests. It is a fact to be faced that the President's forestry and land-law policy must be carried on or extended in the face of opposition from most of the communities directly concerned. That means, among other things, that the Eastern men in Congress and out, representing in this question, as they do, a truly national sentiment, should abandon their attitude of deference to the Westerner's supposedly superior qualifications for dealing with the subject.

In passing a bill to prohibit the disfigurement of natural scenery by glaring advertisements, the House of Commons sets an example which American lawmakers might well imitate. Admirers of the rural landscape are not, as a rule, in search of the best dentifrice, baking powder, malt extract, or hair tonic. Even if they were, the mountain and sylvan regions, where the advertiser's signs often appear, are not places where it is possible to purchase his wares. By the time the traveller has left the place, he has forgotten everything but the outrage of thus spoiling the face of Nature. A foreign visitor to this country remarked the other day that, upon one of his excursions out of town, he had seen nothing but huge advertisements. It is bad enough to make an ugly district still uglier; but to placard the more picturesque spots with obtrusive pictures and announcements is inexcusable. It is encouraging, therefore, to note the growth of the crusade against street signs in this and other cities.

The president of Columbia said recently that a university training is "the surest corrective of the lynching habit"—meaning summary decision and hasty action. This may help explain the prejudice against college-bred men in the world of affairs. The balance of opinion incidental to the scientific temper is thought to make men unduly cautious when promptness is essential. It is a mistake, however, to suppose that aca-

demic training is intended to prepare directly for practical affairs. In most cases it serves rather to offset or correct qualities which a merely active career is apt to exaggerate. The college graduate may be late in "arriving"; but when he does arrive, he has resources which no experience of affairs can supply. Jowett once said: "No man will be a first-rate physician or engineer who is not something more than either, who has not some taste for art, some feeling for literature, or some other interest external to his profession."

Any one who may be appalled at the number of doctors' dissertations now being unloaded at our university commencements can, perhaps, find some consolation in the thought that in Germany conditions are much worse. Columbia has just bestowed the degree of doctor of philosophy upon 41 students; Münster, with 1,256 students, conferred the title of doctor upon 45 graduates in the scholastic year from August, 1904, to August, 1905. Figures for these twelve months have just been published in Germany, and show that, all told, 3,131 doctors of philosophy and law were created by the twenty-one German universities. There were 39,719 matriculated students in these branches of learning in the universities. Of the doctors, 689 were lawyers. Curiously enough, the University of Rostock, with only 102 law students, created 159 doctors of law. One explanation is that this Rostock degree stands higher in the learned world than any other. Hence, students who have studied elsewhere travel to Rostock to take the examinations and carry off the coveted honor, without having been in residence. Leipsic turned out the greatest number of doctors during this period—470. Munich created 282, and Berlin, third on the list, 247. Yet Berlin had 7,774 students in these two branches of learning, as against 3,880 at Leipsic and 4,766 at Munich, from which fact one might draw the conclusion that it is much harder to become a doctor in Berlin than elsewhere. But there are doubtless other reasons which might explain the apparent difference. Fortunately for Germany, the native-born doctors sometimes know their own language, and can express themselves in it. Hence the public escape a good deal of the horrible doctor-English with which Americans are so familiar.

If the "nature fakers" should go into politics, the Democrats could point complacently to the fact that the founder of their party, instead of warring with mere popular authors, came successfully out of at least one scientific controversy with the great Buffon himself. Mr. Jefferson's accounts of species in which he was interested are quite as minute as Mr. Roosevelt's, and the Rev. Mr. Long would undoubtedly find them much less bloodthirsty. The recent sketch of Alexander Wilson, by Dr. J. S. Wilson, contains a letter written in 1805 to the pioneer ornithologist worthy to be bracketed with recent White House magazine articles. Jefferson wrote:

> As you are curious in birds there is one well worthy your attention to be found or rather heard in every part of America & yet scarcely ever to be seen. It is in all the forests from spring to fall, and never but on the tops of the tallest trees from which it perpetually serenades us with some of the sweetest notes, & as clear as those of the nightingale. I have followed it miles without ever but once getting a view of it. It is the size and make of the Mocking bird, lightly thrush colored on the back, & a grayish white on the breast & belly.

The bird found "never but on the tops of the tallest trees" has since been identified with a species of such different habits from those described as to be called the "ground robin," but the error is pardonable. At the same time, the author of the Declaration was not always tolerant of those who differed with him about wild life. His words have again a familiar ring when he says of Daines Barrington, who denied the American origin of the turkey, that "the arguments he produces are such as none but a head, entangled and kinked as his is, would ever have urged."

After the Irish, Nonconformists are now threatening the British Government with vigorous opposition. Although the House of Lords was responsible for the defeat of the Birrell education bill, the measure proposed by his successor, Mr. McKenna, was advanced only languidly in the Commons and finally dropped for the session. As it was, two of its clauses were attacked by all the Nonconformist journals, who remind Sir Henry Campbell-Bannerman that when Gladstone's Nonconformist supporters failed him, he went out of office. To-day, they mutter ominously about again disrupting the Liberal party. The leading Methodist organ says, for example: "The fact remains that the injustice wrought by the late Government remains entirely unremedied." Baptists and Congregationalists make the threat that if "the Government is not going to do something, they must give way to men who will." The *British Weekly* remarked of the McKenna bill: "Of all solutions conceivable, this is the most detestable." Finally, the *Christian World* says that the Nonconformists "will not put up with" the present policy.

Taxation of the unearned increment being a part of the English Government's announced policy of dealing with the land question, a correspondent of the Manchester *Guardian* gives some details about the recent adoption of that method in Germany. Rather curiously, it was first legalized in the German Chinese dependency of Kiao-Chau. This was in 1898. In 1904, it began to be taken up by German cities, Frankfort leading off. Cologne followed, and last March the City Council of Berlin endorsed a proposal to apply the tax without delay. The movement has since rapidly spread. The unearned increment in a piece of property is reckoned as the increase in price, on sale or transfer, over the value at the latest previous sale. Deductions may, of course, be had for all improvements made in the meantime. The rate of taxation is, in Frankfort, 5 per cent., where the increment is from 30 to 35 per cent.; 6, where it is 35 to 40; and so on up to a maximum tax of 25 per cent. The aim of those who advocate the tax is, first, to provide a new source of revenue; second, to prevent wild speculation in land; finally, to improve housing conditions. In an address to the Berlin City Council, the Chief Burgomaster said the tax on unearned increment was "a movement of the times." He added: "The great majority of the representatives of science are also enthusiastically in favor of the tax, and the movement has spread to the widest quarters of society."

Now that the Japanese Home Department has "officially advised" all the Tokio editors to refrain from publishing any matter of an inflammatory nature about the troubles with the United States, one source of anxiety is probably removed. Mr. Root has tried similar tactics here by advising American newspaper men not to publish sensational reports, but he lacks the influence of the Japanese Home Department in such matters. An Administration which has been the greatest source of newspaper sensations for the last three years, and freely uses the press to attain its ends, is hardly in a position to preach soberness and small headlines just at this juncture. Fortunately for all concerned, the general public remains as calm here as in Japan. The London *Times* dispatch, representing the Japanese as being quite unmoved and wholly skeptical about talk of serious trouble, is undoubtedly far nearer the truth than much which has come to us. The educated Japanese feel themselves under a great debt of gratitude to the United States, and hurt and pained as they are by Mr. Roosevelt's change of front since his message of last December, they still do not consider hostilities as in any way possible. But in loss of trade and cordial relations, this country will pay for its ill-treatment of the Japanese.

POLICIES AND SUCCESSORS.

There has been less talk, the past few weeks, about the President's purpose to see to it that his successor shall be a man who will carry out his own policies. This does not necessarily signify, however, that Mr. Roosevelt has relaxed his determination. It is only that the common way of treating the subject has become something of a bore. The propriety of the President's plan has been much discussed; the possibilities of his success canvassed; the probable fall of his choice debated; precedents looked up; politicians sounded. Few, however, have gone behind all this to ask whether it is desirable that any President's policies be "continued," in the sense intended. Still fewer, perhaps, have looked to the deeper political significance of the entire situation.

In it, any detached student of the philosophy of government would be apt to see a tacit confession of weakened faith in democracy. Writers on forms of government, from Aristotle down, have said that monarchies had a great advantage over democracies, because the latter are so fickle. They admit of little fixedness of policy. Plans are as uncertain as rulers. Democracy cannot manage an empire, declares one orator in Thucydides. Another asserts that a democracy is amenable to discipline only while it is frightened. But it is Hobbes who perhaps put the thing most bluntly. "Where the people control," he wrote, "what was concluded yesterday is undone to-day." On the surface, that would appear to be exactly what President Roosevelt dreads. He fears lest the people change their minds; and desires to take a bond of fate that they shall not. But the right swiftly to make a change of policy, as of rulers, is of the essence of the democratic theory.

It is, moreover, a right of which the exercise has often been of the highest value to this country. The policies which were, in appearance, most "settled" have been suddenly upset, and to the general advantage. Suppose Jackson or Pierce or Buchanan had been able to arrange for successors to carry out faithfully their policies, when should we ever have got rid of slavery? The truth is that democracy is a crucible into which all policies have to be thrown. There they are fused in the heat of debate and political passion, and what they will come out, no man can tell. The notion of a continuous policy, born of one President and cherished by his successors, is fantastic. The thing is impossible; if it were possible, it would be hurtful. In 1890, for example, silver purchases and the mad attempt to bolster up bimetallism were the fixed policy of the Republican party. Roosevelt himself was then for it. So late as 1896, he wrote against the folly of the out-and-out gold-standard men. Imagine him President at that juncture, and compassing sea and land to get a successor who would be true to that precious policy of his!

This raises a horrid doubt whether any man could say just what the Roosevelt policies are which must be perpetuated at all hazards. Railway and corporation control, people in general understand them to be; but how can we tell that the President himself will stick to them? He has taken up dozens of other policies, only to drop them. He was in 1902 for tariff revision and a permanent Tariff Commission, but those things are now no better with him than last year's birds' nests. He was hot for Federal control of life insurance, but abandoned it. In all this, he has been a typical Democrat, a splendid opportunist, changing his mind at will. In a certain aspect of his versatile and supple political talent, the words of one of the Olney hymns might be applied to him:

> In evil long I took delight,
> Unawed by shame or fear,
> Till a new object struck my sight
> And stopp'd my wild career.

Yet this most changeable and flexible of democrats, running off after every new object, expects a nation of democrats to take from him a stereotyped policy!

It was the plain-spoken Hobbes, again, who put in his extremely monarchical phrases the loose conceptions which are afloat about the President's intention to secure a successor after his own heart. This is the passage:

> As for the question which may arise sometimes, who it is that the monarch in possession hath designed to the succession and inheritance of his power; it is determined by his express words, . . . or by other tacit signs sufficient. By express words or testament . . . as the first Emperors of Rome declared who should be their heirs.

We have not yet had the "express words," uttered in public, though more than one candidate is intimating that he has been favored with the Rooseveltian "tacit signs sufficient."

The whole idea will really not bear examination. On the practical as well as the theoretical side, it breaks down. We have had many queer things in our political history, but we have never yet had this doctrine of the Presidential dead hand seriously set up.

"EXECUTIVE USURPATION."

In his address at Columbia University Gov. Hughes expressed surprise that he had been accused of "executive usurpation." He described, with perfect truth, his own course as that of a Governor who had endeavored to ascertain what was best for the State, and then had publicly uttered his convictions, inviting and accepting the support of public sentiment. He added that his determination had been to have all these questions of important public policy discussed on their merits, with everything "regarded in the light of reason." By that, he plainly meant that he had not sought to impose his will by the use of patronage, or by entering into political bargains. Granting his clear and open purpose, and looking at the results achieved, it cannot be denied that he makes out a plausible case for his contention that what we have had at Albany this year has been, not "government by executive usurpation," but "government by public opinion after discussion."

Pure theory is, of course, against the Governor. In any strict view of the "division of powers," room cannot be found for such activities as his in directing the course of legislation. No definition of the office of Governor, no written grant of power to the Executive, contemplates a course like that of Gov. Hughes or of President Roosevelt. It may well be doubted, however, if we have ever applied pure theory to the conduct of government in this country. If we had, we should not have been the sons of our sires. It is the merit and even glory of Anglo-Saxon political institutions that they are not neatly logical nor nicely consistent. Bagehot thanked Heaven that Englishmen were not politically lucid, and Americans come in for their share of that ascription of praise. Forcible executives have always made their native vigor felt, despite forms and precedents. Hughes is not so imperious a Governor of New York as was Clinton; nor have the exploits of the Big Stick yet rivalled those of Old Hickory. Emerson pointed out the law of character, going deeper than any rule of politics, that a man of inherent capacity and springing virility can do his work easily even when apparently fettered by the oldest and mouldiest conventions. They give way to his touch of strength.

Many causes seem lately to have been operative in making democracies more tolerant of the exaltation of the executive, or even eagerly welcoming it. Mr. Bryce referred to one of them in his remarks last week at Chicago on democratic tendencies. People are more and more coming to look to leaders. This does not necessarily mean the abdication of individual judgment. Least of all does it signify a hankering for a dictator or despot. Before the elections of 1849 in France, an intelligent Frenchman told Nassau Senior that many farmers and peasants, and especially women, were saying: "We are tired of these Assemblies. *Il nous faut un maître.*" It was a clear sign that Louis Napoleon was coming. But it is in nothing of that spirit of abasement that modern democracies are craving strong leadership. They do not want a master; they are seeking, rather, a powerful servant. What they desire is the

emergence of some man who will both interpret and guide the popular will, and by use of the powers of influential office get that will written into law, or translated into action. It does not matter greatly what the office happens to be called. The desired leader may show himself as Mayor or District Attorney; as Governor or President; less often, as Representative or Senator. The essential thing is that, once the commanding quality is shown, and the great public work set going, the people are certain to rise to the leadership.

There are obvious reasons why these outstanding men should nowadays so frequently be executives. The very mass of men in Legislatures and Congress makes differentiation hard. Only the exceptional members show their heads above their fellows. Constituencies seem more and more inclined to be content with the services of their immediate representatives in the way of "looking after the deestricts," being reasonably honest, and voting as they should on the large questions. But for initiative and large inspiration they are now accustomed to search elsewhere. And one unquestioned function of executives gives them a great opportunity to catch the eye of the public. They have an unchallenged right, as Gov. Hughes said, to "state their convictions," implying the recommendation of laws. Now this privilege, or duty, in the present state of affairs, goes as if made for it with the peculiar enlargement of executive powers which we are seeing in our day. It enables a vigorous and clear-headed Governor, or President, to make himself an advocate with the people, at the same time that he sees to the execution of the laws, and to put himself at the head of movements to secure new laws. In a sense, this is an executive intrusion upon the province of law-makers; but must a citizen be dumb simply because he is Governor? Having been chosen directly by the people to the highest office within their gift, shall he be debarred from saying what he thinks to be for the good of the people? We see how great are the possibilities of that conceded power of the executive to "state his views," and urge them upon Legislature or Congress.

If any man can draw a hard and fast line in these matters of executive usurpation, we should like to meet him. On second thought, we should not like to meet him, for he would certainly be a pedant and a bore. The only really satisfying distinction, for the individual critic, that we ever heard of is that of the old gentleman at Washington who said that he liked to have the President interfere in behalf of what he himself wanted, but was ready to have impeachment proceedings begun when the President took the other side. In our hearts, most of us come pretty near that position. There is, however, one sharp division that can be made. A Governor may impose his will upon the Legislature as Hill did, or Odell did—that is, by appeal to corrupt motives, either personal or political. That sort of usurpation is always to be condemned, not because it is usurpation, but because it is corruption. Between that and the method which Gov. Hughes has followed, there is all the difference of night and day.

THE HAGUE OUTLOOK.

The dispatches from The Hague picture the opening of the Peace Conference as distinctly gloomy. The failure of President Roosevelt to take a strong stand for a discussion of the limitation of armaments, and the troubles in Russia, are but two of the causes that seem to doom the Conference to impotency. But it is far too early to lose courage. Even the limitation of armaments may be reached in a roundabout way, and some definite advances must surely be recorded, if not in the way of preventing war, at least in the methods of conducting it. The delegates cannot fail to realize the immense value to mankind of such a gathering, and they will certainly endeavor to agree on some positive measures, if only for the sake of the prestige of the Conference.

At any rate, there is no reason yet to speak of the Conference as "The Farce at The Hague," as does Frederic Palmer in the current *Collier's*. Writing from the standpoint of a professional war-correspondent, he sneers freely at some of the obvious inconsistencies at the Conference, notably the presence of naval and military delegates; and dwells upon the certainty that no delegate will rise in his seat and say: "Gentlemen, in the event of war, this proposal would be prejudicial to the nation I represent, but, as we come here to sink selfishness, in the name of humanity I will gladly support it." But while no delegates will probably be found to state this openly, it is by no means impossible that some of them will act in accordance with this sentiment. Take the question of the inviolability of private property at sea. England has most to lose by the establishment of this doctrine, and her jingo papers are already protesting against any assent to it. Yet some of her foremost legal lights have favored it, and the well-known pacific character of the present Liberal Government makes it incredible that it would instruct its delegates to hold out against such a proposal. A Ministry which offered to limit its naval increase could be guilty of no such inconsistency.

But there are plenty of other examples of loose and superficial thinking in Mr. Palmer's article, before he reaches a thorough *non sequitur* in declaring that a "strong arm and sweet and reasonable temper form a golden rule for nations as well as men," and that "modern war, so largely waged with the intellect, has inherent humanities far outstripping the Red Cross. It gives strength to those who know how best to use it for the good of the world." Of course, every nation thinks that it alone knows best how to use its power for the good of the world. Again, Mr. Palmer as an argument to belittle the Hague gathering employs statistics to show how the cost of the navies and armies of the world has increased since 1897 in proportion to the growth of commerce and population. Thus the cost of the American army has been enlarged 253 per cent. in the last ten years, and the navy 240 per cent.; the German taxpayers pay 288 per cent. more for their navy and 55 per cent. more for their army; Great Britain's increases are 63 and 59 per cent., and the comparatively impoverished Japanese are now compelled to pay 200 and 309 per cent. more for their armaments than they were ten years ago. But this increase in financial burdens is the very reason why every right-minded man should seek to encourage the Conference, not to gird at it.

Leaving aside all questions of morality and Christianity, the fact is that the European nations are headed straight for bankruptcy; that within a comparatively brief period the growth in the cost of armaments must make them look to The Hague in an entirely different spirit from that which now actuates them. We do not mean to bring up here the old simile of the peasant staggering under the burden of the armed man he carries on his back. It is far more effective to treat of the nations as a whole. Why is the British income tax to-day, four years after the peace treaty in South Africa, higher than at any time since the Napoleonic era, excepting only the period of actual hostilities during the Boer and Crimean wars? It has been admitted openly that this is entirely due to the steadily increasing cost of the navy. As England's population has increased only 8 per cent. since 1897, it is obvious that the added burdens bear more than ever heavily upon the public. On the Continent financiers have long been dwelling with alarm upon the inability to get capital in sufficient quantity to supply the needs of trade and commerce, with the result that there has been for twelve years past a steady decline in the value of the most gilt-edged securities. While there are several reasons for this depreciation, the best foreign economists invariably include among these causes the great expansion of national debts, due to recent wars, and precisely that increase in cost of armaments to which Mr. Palmer refers. He proclaims that killing power means peace; but it als-

means financial shipwreck, if it continues to cost as it does.

Nor does the United States escape. J. J. Hill has recently pointed out that the difficulties of the railways in raising capital in this market, where governments as well as industry are competing with them, threaten "commercial paralysis," which means "slow death." Plainly, on the financial argument alone, the Hague Conference ought to have the strongest possible support. When a spendthrift heads for ruin by striving to outdo others in lavish outlay, his friends get together to lock up either his checkbook or himself. The possession of armaments has become a veritable madness that calls for the doctor—not the old-fashioned bleeder, but the scientific physician of to-day, who seeks the evil, and, having discovered it, treats it sanely.

THE RUSSIAN DISAPPOINTMENT.

The dispatches of last Monday made it clear that the abrupt dissolution of the Duma was the Czar's work. Apparently, he overrode the ablest of his own Ministers, including the Premier. The world had hoped better things of Nicholas, but it forgot how deeply ingrained in him was the absolutist tradition. The idea of any political body limiting his authority, or refusing to bow to his will, is evidently as foreign to his mind as to that of the Sultan of Turkey. The short-lived Turkish Parliament was abolished with as little ceremony, and for about the same reasons, as the Duma. Nicholas cannot, any better than Abdul, bear a brother near the throne—even when that brother is a lawfully chosen representative assembly, whose privileges he had vowed to respect and whose powers to validate.

The Czar's ruthless disregard of his promises to the Russian people, as of the obligations which he assumed in the face of all civilized nations, makes his proposal of a third Duma, to be constituted under a new "electoral law" of his own devising, seem highly farcical. It is plain that what he really wants is, not a true Parliament, but a pliant Council of State. If the new Duma, in case there be one, does not cringe before him, its life will be ended as summarily, and with as little regard for the Czar's pledged word and fundamental guarantees, as has been that of its predecessors. Seemingly, the very conception of constitutional government under a limited monarchy, has no more entered the head of Nicholas II. than it has that of a Moro Datto. There stood his solemn promise, on the convocation of the first Duma, that the electoral law should not be changed without its consent; but such restraints are no more to him than so much pack-thread. Towards his own pledges, and even the fundamental laws, his attitude is very like that of the old Legitimist of France who talked to Niebuhr about the Charte. He said that the king had granted it, but that, of course, nobody expected him to be bound by it.

Say what one will about absolutism being no concern of the Hague delegates, its unpleasant effects cannot fail to disturb them. The thing may come home to them in the most practical way. Suppose that the members of the Duma under the ban seek a refuge at The Hague? It is already reported that they may. Imagine them issuing a manifesto, reciting their grievances and the Czar's faithlessness, under the very shadow of the Peace Conference! When the previous Duma was dissolved, the news came at the time of the sittings of the Interparliamentary Union in London On that occasion the Prime Minister of England boldly raised the cry: "La Duma est morte. Vive la Duma!" Probably no one at the Hague Congress will be guilty of so splendid an indiscretion; but it is certain that the French and English and American delegates will wish that the utterance could be made with propriety.

Outsiders scarcely expected the Russian *coup d'état* to be submitted to so quietly. The prevailing calm, so far, may be variously interpreted. Possibly, it signifies exhaustion, for the time being. The Russian people have been in continuous turmoil for more than a year; and the most fiery enthusiasm cannot flame forever. This would especially be the case when the people saw that the Government had carefully taken its measures, and was in a position to put down any violent resistance. If this be so, it is undoubtedly better that order should "reign at Warsaw," and elsewhere throughout the Empire, in consequence of temporary submission, rather than of a rising and a massacre. But the dispatches are most misleading if they do not indicate a firm purpose on the part of Russian patriots to press forward towards representative institutions. They propose again to measure their strength in elections, even though grossly discriminated against in the franchise and in representation. It would be strange, too, if the Terrorists should not resume their activity. Their dreadful work is given fresh provocation, though not a defence, by the absolute muzzling of the press; for, as Wendell Phillips said in his Phi Beta Kappa oration on Russian Nihilism, where public discussion is not allowed, bombs are certain to be hurled and daggers driven home. And with all its apparent security, the Government cannot be sure of its own weapons of repression. Mutterings of mutiny in the fleet have been heard, and may be in the army also. In any case, the great Russian experiment in liberty cannot end here.

DOMESTIC EXCHANGE OF PROFESSORS.

An editorial note in the June number of the Columbia University *Quarterly* contains a suggestion worthy of serious consideration. It is to the effect that, while the foreign interchange of professors has been encouraged and systematized, a phase of academic coöperation which could be made a most valuable adjunct of instruction in our colleges and universities lies comparatively overlooked and unused. What is meant is a more widely developed domestic interchange between American institutions than has hitherto been attempted, to the end of making it possible, by a temporary loan, to round out the instruction in a given institution. This, in its turn, would be glad to give a *quid pro quo* in another field. The condition is, of course, not altogether a new one, since the non-resident professor who delivers a course of lectures, or even assumes further academic duties for a year or a semester, is well known in this country; but the procedure, at present, is characteristically haphazard.

Even a hasty review of the situation will convince one of its latent possibilities. There is, let us say, but a single great exponent of "pragmatism," who belongs to the philosophical department of a certain university. Its neighbor university, however, though suffering from a pragmatic famine, has a master of protozoölogy, which the first has not been able, for some reason or other, to include among its subjects of instruction. Nothing could be more feasible than for the two institutions to make the required exchange. It could be done, not only without detriment to the interests of either, but to the positive advantage of both. The temporary withdrawal from the corps of instruction of one man would really amount to but little in the department immediately affected, and would be more than offset by the ultimate gain to the professor himself as a teacher, in the revivification that should come to him from contact with new minds and inspiring conditions. Both institutions would gain in prestige by the transaction, because it would publicly appear that each has a distinguished scholar whom it is desirable for the other to borrow. It would be distinctly to the advantage of the student, for it would give him an additional opportunity to supplement his education, and would widen his academic horizon by reminding him that his own college walls are not necessarily the boundaries of human knowledge.

A domestic system of professorial interchange would be especially valuable in the graduate work of the university. In the notable homogeneous organization of graduate instruction that is being evolved in the universities of America, it is plain that not only is parity

of standard necessary, but that mutual coöperation is quite as indispensable. The rivalry that has existed among the colleges, and to a certain extent exists still, is doubtless justified, in a measure, by differences of opportunity in the curriculum, and by a consequent standard of value in the degrees bestowed. These differences, however, in later times are tending to disappear.

In graduate instruction this academic rivalry, from the nature of the case, has scarcely existed. Some institutions have developed the graduate side of their activity rapidly, some slowly, and some not at all; but where it has been done it has taken place along lines singularly homogeneous in point of standard. Not all universities, however, have developed all sides of graduate study harmoniously, nor is it at all necessary that each should cover the entire realm of learning. More could be accomplished by American universities if each made particular effort to exploit exhaustively at least some one phase of knowledge, while conspicuously neglecting none. A wide interchange of professors would greatly facilitate such a process and would benefit largely the whole cause of learning, for it would render possible, to a degree not hitherto attained, a systematic supplementing of the work, with a consequent decrease in the costly duplication of equipment at present involved.

The education, too, of the university, even more than that of the college, is a question of men. It is still a question, primarily, of course, of subject; but in the final development of any subject it is the great individual teacher who leaves the deepest impress upon the student's mind. This condition is met in Germany by the well-recognized system of student migration, which is encouraged by the universities. They demand but a single matriculation at the beginning of the period of university study, and allow freedom of residence for longer or shorter periods in any of the twenty-one universities of the land, with the option of taking the final examination—and the only one—at whatever university may be preferred. It is an established part of such a system that the student shall seek, in his specialty, the instruction of the great men who are expounding it; and it is possible, in this manner, to get all sides of a subject under equally favorable conditions. The migration of graduate students in American universities has become in late years perfectly familiar, although for various reasons it has not yet developed into the system of correlation and coöperation which characterizes it in Germany. All of the greater universities draw a large part of their graduate students from other colleges than their own; and, with the recognition of the need of many colleges and few universities, which is sure to come, this will be more and more the case. The idea, however, is not yet firmly implanted in the American mind, and the advantages of student migration are neither plainly preached nor widely practised. In the meantime, as the *Quarterly* remarks, if the mountain will not come to Mohammed, Mohammed can go to the mountain; and an active professorial exchange would make up, to some extent at least, for the disabilities of the present uudeveloped system of student interchange, while greatly strengthening the whole system of graduate instruction.

The foreign exchange of professors is a graceful act of international comity, and interesting as an experiment in the history of education. There is far larger promise, however, on the purely academic side, in the domestic exchange that is proposed in the *Quarterly* article. Yet, because of its familiar and nearby character, it has been neglected. Like the young man in Hawthorne's well-known story, our educators have sought round the world for the treasure which lies buried, after all, at their very door.

THE VANISHING MANUSCRIPT.

If the world were to be informed that after a certain date no pictures would be painted, and the "art photographer" would enjoy a legal monopoly of the field, it is safe to say that the galleries would be filled with eager and regretful throngs. Some such wistfulness must be felt by any one who visits a collection of authors' manuscripts. It represents a dying art, almost as truly as a series of illuminated missals. Within a few years, authors' manuscripts, in the strict sense, will virtually have ceased to exist. We mean not only that such calligraphy as one may note in a Petrarch, or, the other day, in a Lafcadio Hearn, will be no more; not merely that such masterful cuts and thrusts of the pen as one sees in the book of Benvenuto Cellini at the Laurentian will no longer be delivered, but that literary manuscripts of the commonest sort will be rare enough to be valued as curiosities.

Literary relics of some sort will, no doubt, persist. One can hardly imagine, however, much sentiment being expended upon the almost universal typewritten copy. Well scored by the pen, it may afford a kind of substitute for the real thing. At any rate, that will be as near an approach to an author's manuscript as our children may fairly hope to collect. Undoubtedly, those who profess the refinements of the pursuit will try to distinguish between a bit of copy that a famous author typed himself; that which was produced by his secretary; and that which was done at random in a public office. Along these lines one may foresee a new and difficult science of bibliography. Writing machines will be put under glass as quill pens and inkpots now are. Scholars will die for it that in a certain year Howells changed a Hammond for a Remington, or vice-versa. Doctoral dissertations will be written to prove just when James set up an amanuensis—a date possibly not without serious bearings on his later manner. What posterity will do in the case of the famous humorist with whom composition has long consisted of daily loquacity before a phonograph, we may only dimly imagine. It is evident that his "cylinders" will deserve to be exhibited as original notes. The comparison of these mechanical records with the final literary product might be a task no less arduous, if possibly less rewarding, than the editing of Pascal from the confused mass of the manuscript "Pensées."

In any case, the disuse of the pen for literary purposes, or at least its restriction to rough notes, seems certain. Publishers' readers already classify writers as those who thriftily do their own typewriting, and those who are prosperous enough to have it done with professional immaculateness. Those who write with the pen represent a mere remnant. It would be interesting to inquire if the few penmen are not also an élite. It is certain that dictation makes for diffuseness. Herbert Spencer, for example, in the preparation of the definitive edition of his works, found that he could regularly cut out a quarter or so from all books composed after the employment of an amanuensis, whereas the earlier volumes were of a texture so close that little condensation was possible. It is premature to assume that the passing of the pen involves a decadence in style, but such a fact as we have cited affords a presumption that an author with whom style is a chief concern should himself manipulate the typewriter or stick to the obsolescent pen.

Commercially, at least, authors' manuscript must become a rare and costly commodity. A literary manuscript fairly written with the pen in the first quarter of the twentieth century, should by the twenty-first hardly yield in rarity to a book printed, say, in the last quarter of the fifteenth. One may imagine the casual scrawls of Mr. Penny-a-liner acquiring as factitious a value as, for instance, the calligraphy of Goethe's washwoman. And here is opened a way by which the farsighted but unsuccessful author may make dignified provision, if not for himself and the hungry mouths about him, at least for his children's children. Whoever will leave in trust for a matter of a hundred years a portly bundle of literary manuscript, good, bad, or indifferent, may count upon a moderate bibliographical notoriety at the end of that period, and may enjoy the more humane satisfaction of knowing that his descendants

will find both comfort and a certain measure of fame.

Such a prospect should go far to console the machineless author when confronted with the cruel notification that only typewritten or clearly legible manuscripts are considered. It should also soften the blow of unconditional rejection to reflect that, to the proverbial blindness of publishers and editors, may now be added their crass inability to realize the potential desirableness of the few real manuscripts that still come under their eyes. If *scriptum est* will in the near future imply a distinction, old-fashioned lovers of the pen may find compensation for the cold welcome and short shrift they too often receive in the present.

THE FRENCH REVIEWS.

PARIS, June 7.

Some late reviews contain important material, which cannot be found elsewhere, on subjects now uppermost.

"Syndicalism" is in France the new, all-absorbing form of Labor's conflict with Capital. Its growth has been so rapid that its gravity is not appreciated abroad. This year, even more than last, the strikes and other "direct action," which it has combined, have upset the industrial life of the country, and forced the attention of Parliament and Government. It is non-political, but Socialist and Radical Socialist political parties are obliged to become its instruments. It refuses such labels as Socialism, Collectivism, Anarchy, Reform, or Revolution; and it ought not to be brushed aside as mere revolutionary Trade-Urionism. It is extra-Parliamentary and extra-judicial, although it tries to keep within the laws; but it is suspected with reason of going in for anti-militarism, and even international anti-patriotism. It might well be the nearest outcome of the Labor movement in all countries.

It has hitherto been difficult to trace the history of this organized agitation, which was fullblown before the world knew of its existence. For the one evil which it recognizes—the dualism of society from the inequality of wage-earners and wage-payers—it proposes one remedy—free and equitable contract, to be obtained by "syndical action." This does not mean by each trade-union separately, but by the federation of all labor unions, which in France now means the "C. G. T."—Confédération Générale du Travail. It fulfils, by its "direct action," Proudhon's "revolution of folded arms"; and Waldeck-Rousseau made it possible by his laws of 1884 and 1901. He said officially at the time: "Government and Parliament have not allowed themselves to be terrified by the hypothetical danger of an anti-social federation of all workers." Those who wish to follow the hypothesis under rapid verification may read a complete and favorable and documentary article on the history and present state of Syndicalism, published by Félicien Challaye in the *Revue de Métaphysique et de Morale* for January and March, 1907. In the two latest numbers of the *Grande Revue* (May 10 and 25), there are short, clear expositions, divergent in tendency, by Paul Robiquet and Ferdinand Buisson; the latter, who has been the philosopher of Radical Socialism from its start, frankly names his article "The Syndicalist Crisis."

Those who wish a clear idea of the Naturalist school of literature, of which Zola was the godfather, will find it succinctly expressed in a pathetic article of one of the first five disciples, Henry Céard, who explains how another of the five—J. K. Huysmans, who has just died—finally broke the narrow bonds of the *roman de mœurs* wherein Zola's characters wrought out their genealogy on impulse and instinct, without soul. Céard corrects slightly the account given by yet another of the five, no less a man than Guy de Maupassant. He adds: "The time is not far when Huysmans will be considered the prophet of the Realism of the future" (*Grande Revue*, May 25).

The thought of a man who views human events from so high a standpoint as did Alexis de Tocqueville does not lose its importance as the world moves on. The *Revue des Deux Mondes* (June 1) gives a first series of extracts from a correspondence with Count Arthur de Gobineau, the French generalizer, whose books are all but unknown in his own country, and all but classic in Germany. The originals are preserved in Strasburg; the curator, L. Schemann, seems to have an entire volume quite unpublished in hand. This first instalment deals with the history of popular morals and the possibility of such morals without religion or tradition. The letters were written with a view to a hitherto unknown work in collaboration; they date from the years when the shortlived Republic of 1848 was sinking in the Second Empire, and present in milder form the pessimism which distinguishes Taine's recently published correspondence.

The *Mercure de France*, which is considered a review of the young, has succeeded in eliciting for its three latest numbers and others to come an expression of views on the religious crisis from dozens of the most varied authorities, French and foreign. There is great and fundamental divergence in the notion itself of religion, from those who hold it a lucid intellectual act to those who set it down as specifically a thrill of the solar plexus. Also some think religion dead finally, while others are equally certain that it is more alive than ever; and yet others, who acknowledge the thing to be undying, would fain change it into something else with the same name. The illustrious signers of the opinions guarantee the good faith of this confusion of minds.

Fifty years having elapsed since Alfred de Musset's death, his works by the French copyright law now fall into the public domain. Musset, whatever critics may say, has a continued popular sale, which Victor Hugo never had. Publishers are taking advantage of this to bring out editions at pleasure, even one "for the family" edited by Émile Faguet. But this also alarms living authors, who fear that their own sales may be injured by cheap editions of the dead man's work. They ask new legislation. Marcel Prévost thinks copyright should last as long as there is a direct representative of the author's family, like all other property. Another asks that the state should levy 10 per cent. on all publishers' receipts from books without copyright! What will happen when Dumas's novels go out of copyright?

S. D.

NEWS FOR BIBLIOPHILES.

The original Waldseemüller map of 1507, which was found by Professor Fischer in 1901 in a bound volume in the library of Wolfegg Castle, in Germany, is now offered for sale. This, the first engraved map containing the name America, had long been diligently sought for. In the "Cosmographiæ Introductio," the first edition of which was published at St. Dié, in the Vosges Mountains, on the Kalends of May, 1507, it was first suggested that the new land be named America "because Americus discovered it." The book purports to contain the principles of geometry and astronomy as well as an account of the four voyages of Vespucius. The title makes mention of "a representation of universal cosmography both in solido and in plano" on which was inserted "what to Ptolemy was unknown and lately discovered." On the back of a folding diagram in the book is a description of the globe and the map referred to. This was pointed out by Humboldt, and since his day the globe and map have been sought for. The map, it was supposed, was too large for insertion in the volume, but no one expected to find such a cartographical monster as it turned out to be on its discovery. It was printed from wood blocks on twelve sheets, each measuring (on an average) 23½ inches by 17½ inches (exclusive of margins), and the complete map when put together measures about 8 feet long by 4½ feet high. The sheets of the copy preserved at Wolfegg Castle were not joined together, as was intended, but were bound up with other maps in an atlas. This probably accounts for its preservation, the only specimen, apparently, which has survived four hundred years, out of one thousand copies which are known to have been printed. In the same atlas was another map, the "Carta Marina" of 1516, also by Waldseemüller. The existence of this second map was not known before its recent discovery. It is made up of twelve sheets of the same size as the 1507 map. The owner of the atlas, His Highness Prince Waldburg-Wolfegg-Waldsee, offers the volume for $300,000, the London booksellers, Henry Stevens, Sons & Stiles, being his agents. The map is of great interest and value, but the price put upon it is beyond reason.

Major E. S. Turner, who since its organization has been the manager of the Merwin-Clayton Sales Company, has severed his connection with that concern, except as a stockholder, and has acquired a controlling interest in the older house, the Anderson Auction Company. They promise numerous important sales next season. They have a sale Monday afternoon, and sales on Monday, Tuesday, Wednesday, and Thursday evening. There are few notable items in the three catalogues, the most important being a copy of Hawthorne's "Gentle Boy," 1839, in the original paper cover, which will be sold Monday evening. C. F. Libbie & Co. hold their last sale for the season on June 25 and 26. The books offered are very miscellaneous in character, and seem to be the cleaning up of the season's business.

Scott's autograph manuscript of his "History of Scotland," which went for £510 at Sotheby's on May 31, had been twice sold at auction in New York. In the Fredrickson sale, in May, 1897, it brought $245. It was

shortly afterwards acquired by the late Bishop John F. Hurst, and when his library was sold in March, 1905, the manuscript brought $1,600. The following are a few other important records at the same sale at Sotheby's: FitzGerald's "Omar Khayyam," 1859, £41; Caxton's "Golden Legend," 1483 (imperfect), £480; Goldsmith's "Haunch of Venison," 1776, uncut, £43; Byrou's "Fugitive Pieces," corrected proofs for the "Hours of Idleness," 1806, £182; Shakespeare, First Folio, 1623, £2,400; Second Folio, 1632, £140; Third Folio, 1663-64, a very fine and desirable copy, £1,550; "The First Part of the Contention," 1594 (only one other copy known), £1,910; "King Richard III.," 1629, £80; "Merchant of Venice," Heyes imprint, 1600, £510; "Merry Wives of Windsor," 1619, £100; "King Lear," the Pide Bull" edition, 1608, £250; "Hamlet," J. Smethwicke, n. d., £180; "Arden of Feversham," 1592, £1,210; "London Prodigal," 1605, £51; Yorkshire Tragedy," 1619, £46.

Correspondence.

COLERIDGE ON THE SPIRIT OF APOSTASY.

To the Editor of The Nation:

Sir: I had recently an opportunity of examining the copy of the "Select Discourses of John Smith" (1660), with the marginalia of Coleridge. Most of these have been printed, though with some editorial emendations—or variations. Two passages, however, I do not find in either the "Literary Remains" or the "Notes on English Divines." They have some interest as expressing Coleridge's view as to the ethical significance of the Evil Principle whether known as Satan, the Devil, or the Old Dragon.

There is a characteristic passage in Smith (p. 459), where he says: "The Old Dragon mentioned in the Revelation with his tail drew down the third part of the stars of heaven and cast them to the Earth"; ou which Coleridge has the following note:

How much it is to be regretted, that so enlightened and able a divine had not philosophically and scripturally enucleated this so difficult yet import[ant] question respecting the personal existence of the Evil Principle, *i. e.*, whether as το δεῖον of Paganism is ὁ θεος in Christianity, and so the το πονηρὸν is to be ὁ πονηρος? and whether this is an express doctrine of Christ and not merely a Jewish dogma left undisturbed to fade away under the increasing light of the Gospel instead of assuming the former and confirming the position by a verse from a poetic tissue of visual symbols—a verse alien from the subject, and by which the Apocalypt enigmatised the Neronian persecution and the apostasy through fear occasioned by it in a large number of converts! S. T. C.

Further on (p. 463) Smith says: "When we say 'The Devil is continually busy with us' I mean not only some apostate spirit as one particular Being, but that spirit of apostasy which is lodged in all men's natures; and this may seem particularly to be aimed at in this place, if we observe the context: as the Scripture speaks of Christ not only as a particular person, but as a divine principle in holy souls." On which Coleridge observes:

May I not venture to suspect that this was Smith's own belief and judgment! And that his conversion of the *Satan, i. e.*, circuiter or minister of police (which our Sterne calls the Accusing Angel), in the Prologue to Job into the Devil was a mere condescension to the prevailing prejudice? Here, however, he speaks like himself and like a true religious philosopher, who felt that the personality of Evil Spirits is a trifling question, compared with the personëity of the Evil Principle. This is indeed most momentous.

In a note written on the fly-leaf and printed in the "Literary Remains," Coleridge remarks that "an account of the Cambridge Platonists would make a delightful and instructive essay." What a pity that his study in March, 1824, of the sermons of John Smith, a distinguished member of this remarkable group of thinkers, did not lead him to accomplish his project.

William E. A. Axon.

Southport, Eng., June 6.

SCIENCE FOR GENERAL STUDENTS.

To the Editor of The Nation:

Sir: Of the various circumstances which our descendants will point to as indicating the thoughtlessness of the present generation, none will be more conclusive than the way that some of our colleges have of providing for the scientific education of their non-scientific students. If a student is making a special subject of literature, for instance, what he needs to know about science is (1) the character of its methods, and (2) its main, important, results. The right way to secure this knowledge would be by a general course, covering a year of solid work, devoted to physics, chemistry, and biology, given either by a professor of rarely wide interests, or—what would usually be the best thing attainable—by three different professors. What is actually done in some of the colleges is to require the student to take one year of any one science he may happen to choose, which means usually that one—it might be geology—which he thinks he can slip through most easily, and to take it with the students who are being given their introductory year to a special course in the subject. But this is not to accomplish the object, (1) for the methods employed are too minute and detailed for the general student—he cannot see the woods for the trees; and it is to throw away the opportunity to gain the splendid—the indispensable—object (2). An educated human being who does not start life with a general knowledge of the results of the three great sciences is not educated, in the proper sense of the term. Is not this plan extremely unreasonable, or, to say the least, thoughtless? Has not the poor student a right to take it ill that his interests are so little considered? L. M. N.

THE UNIVERSITY OF MAINE.

To the Editor of The Nation:

Sir: Were it desirable to consume more of your valuable space in discussing the University of Maine, I should be glad to show several of the errors into which Mr. George L. Fox has fallen through ignorance of the facts about Maine educational conditions. For example, the University of Maine has *not* received "most of its money" from the State Treasury, does *not* give "free instruction," benefits *all* classes of citizens, has *not* "injured greatly the small colleges"; the statistics given of students in the institution are quite incorrect, and President Hyde did *not* at all oppose a large appropriation for it.

As to the argument that it is unjust to tax the many where the direct benefit goes only to the few, a little reflection will convince your readers that that principle is contradicted throughout our whole system of taxation, and must be. If I have no son of my own to be instructed, I pay my school tax like a good citizen, just the same, and derive infinite advantage indirectly from the higher education of others.

Karl Pomeroy Harrington.

Middletown, Conn., June 13.

"THE PIERIAN SPRING."

To the Editor of The Nation:

Sir: In looking over Drayton's "Of Poets and Poesie" the other day, I stumbled on the following lines:

Next these learn'd Jonson in this list I bring,
Who had drunk deep of the Pierian Spring.

Why has no editor of Pope pointed out the resemblance between his famous couplet and the lines of Drayton just quoted?

C. T. Copeland.

Cambridge, June 14.

Notes.

Bernard Shaw's "John Bull's Other Island and Major Barbara" is about to be issued by Brentano's.

Early in the autumn the Macmillan Company will publish the letters of "that witty and learned cleric," Dean Hole.

Two books of memoirs are promised, which ought to contain much interesting matter. One is the reminiscences of Sir Edward Clarke, journalist, lawyer, and statesman; the other of the eminent illustrator, Walter Crane.

Next month Phillimore & Co. publish the "Guild Book of Stratford-upon-Avon," translated and edited by J. Harvey Bloom. It contains lists of admissions to the guild for the 130 years previous to the beginning of parish registers.

Thomas Y. Crowell & Co. are about to publish an English translation of Ellen Key's "Century of the Child," which has caused so much talk in Sweden and Germany.

Edgar Prestage is writing a history of Portuguese literature—the first since the translation of Bouterwek's about a hundred years ago.

Hopper Striker Mott is preparing a history of "The Church at Harsenville," commonly known as the Bloomingdale Reformed Church. The work is to contain a large amount of topographical and genealogical matter, and illustrated with many hitherto unprinted views obtained from family sources.

J. St. Goar of Frankfort has published a "Stammbuch der Frankfurter Juden, von 1349-1849; mit einem Plane der Judengasse," by Dr. Alexander Dietz. The work contains the history of 625 Jewish families, besides much kindred matter.

Bernard Quaritch, the great bookseller, has moved his London establishment to No. 11 Grafton Street, New Bond Street, W.

Classical scholars, and particularly students of Homer, will be glad to have the short memoir of David Binning Monro, translated, with slight alterations, from a notice by J. Cook Wilson in the "Jahresbericht über die Fortschritte der klassischen Alterthumswissenschaft" (the Clarendon Press). The frontispiece is a capital photogravure portrait of the late Provost of Oriel College at his working table.

In recording the publication of "The Statesman's Year-Book" for 1907 (The Macmillan Co.) we need do no more than mention the more important changes and additions as pointed out by the editors of that invaluable work. The section dealing with the West African British Possessions has been rearranged, while Bolivia and Venezuela have been largely rewritten. The Transvaal Constitution and the Persian Constitution are included, with other new matter of history. The sections relating to the armies of the various states have been entirely rewritten by Major-Gen. P. J. Maitland, C.B. Tables and diagrams showing the growth of the navies of the world have been constructed by Fred T. Jane. In the present edition the United States occupies 262 pages, the British Empire 399, German Empire 120, and France 95.

The work of the Federal Government in increasing and enriching the supply of food and game fishes in every section of the country is described in the *National Geographic Magazine* for June by the well-known ichthyologist and deputy commissioner of fisheries, Hugh M. Smith. Its special features have been the interchange of fishes between the Eastern and Western parts of the country and the importations from foreign lands. Among the most noteworthy achievements are the introduction of trout into Colorado, which is now the best-stocked State, and the colonization of shad and striped bass on the Pacific Coast. The contributions of the West to the East are mainly rainbow trout and the Pacific salmon. He devotes considerable space to the most widely distributed of our fish immigrants, the much abused carp, and commends it for its great economic value. Among the objects under consideration are the acclimatization of the dwarf salmon, pearl and edible oysters from Japan, and toilet sponges from the Mediterranean. Allied to this subject are the notice of Dr. T. Gill's monograph on fishes that build nests and take care of their young, and some notes on the remarkable habits of certain turtles and lizards. The illustrations, now the marked feature of the magazine, are of the Bighorn Mountains of Wyoming, "the wildest Alpine scenery in America," Dutch and British Guiana, the latter being accompanied by Prof. Angelo Heilprin's entertaining impressions of the Guiana wilderness and its wonderful forest.

The admission of women to the graduate work of the Johns Hopkins University, by a unanimous vote of the board of trustees, has aroused no special attention: this is the last stronghold to fall, and it may be considered that, as regards education, the battle begun by Elizabeth Blackwell, and other ardent fighters of her day, has now been won. As the latest sign of the good use which the privileged women of to-day are making of their facilities, it may be noted that the student taking the highest honors this year at Dickinson College is a woman, and that four women out of six students got the Phi Beta Kappa election.

A comparison of the figures for attendance at the Asheville conference of the American Library Association with those of the conference held at Atlanta eight years ago shows a striking growth of interest in the work. At Atlanta the total attendance was 215, and the number of delegates representing Southern States thirty-four, of which more than a majority were from the city of Atlanta itself. Such important States as Virginia, Alabama, North Carolina, and Florida were not represented by a single delegate. This year the total registry of delegates was about 415, of which no less than ninety were from the South. North Carolina, which eight years before had no delegate, was represented this year by thirteen. Nineteen delegates registered from Georgia, giving that State sixth place in respect to size of delegation, and placing it above Connecticut, Michigan, Iowa, Ohio, and Indiana. Kentucky, which at Atlanta was represented by one delegate only, had at this year's conference a total of twelve.

An interesting exhibition of objects illustrative of Greek and Roman life has just been opened at the British Museum. It is a tentative experiment with the aim not only to serve an educational purpose, but also to aid those who would penetrate the secrets of ancient thought and art which were so closely interwoven with the threads of ancient life. The objects are divided into two main sections of public and domestic institutions. In the first, the drama, religion and politics, the palæstra and the circus, and war are represented. In the other are to be found children's toys and games, and objects showing lessons in reading, writing, and painting. Among these are a wax tablet inscribed with a multiplication table from 1×1 to 3×10; a potsherd painted with a spelling exercise, combination of each consonant with each of the vowel sounds arranged in order; and a recitation-board with six lines of the Iliad, set out probably for the pupils to recite in unison with the master. There are also dolls, dresses, furniture, terracotta boats, etc., and two double-cylindered force pumps, used for fire-engines, and showing that our modern engines have gone but little further in these 2,000 years.

Russian papers report that the Government has practically decided upon the establishment of a new university in the northwestern part of the empire, in the Volga districts, preference being shown to the city of Woronesh, which makes the largest offer of financial assistance. This step is the result of the proposals of a committee of professors from the Russian University of Warsaw, and the Government is now chiefly concerned about the selection of a proper teaching corps.

The educational department of the French Government has published the university statistics for the last academic year. The whole number of students enrolled in the universities was 38,197, and of these 35,638 were men, making the woman contingent 2,559. Of the men, 33,399 were French and 2,239 foreigners, but more than one-half of the women were outsiders, namely, 1,195. The total enrolment of foreign students is accordingly 3,434, which is a considerable increase over the proportion some years ago, this change being doubtlessly the result of the systematic agitation started about a decade ago for the purpose of attracting students from abroad. As a consequence the percentage of foreigners in the French schools is now about equal to that in the German, and in excess of that in other European lands. The preponderance of the university in Paris is overwhelming, the enrolment being 15,789 students. Berlin holds no such prominence in Germany, reporting less than one-sixth of the total student body. The attendance at the other French universities is as follows: Lyons 2,786, Toulouse, 2,675, Bordeaux 2,469, Nancy 1,841, Montpellier 1,752, Lille 1,560, Rennes 1,498, Aix-Marseilles 1,269, Dijon 966, Poitiers 962, Grenoble 896, Caen 814, Besançon 325, and Clermont 281. The total enrolment in proportion to the population is about the same as in Germany.

The *Ferienkurse*, or vacation lectures, at various German universities, introduced in recent years, have assumed an especially wide scope in Jena. They are announced for the 5th to the 17th of August, and this year will be divided into six departments, viz., natural sciences, pedagogy, psychology, social sciences, theologico-philosophical, and languages. The total number is forty, about one-half being major courses of twelve hours each, and the other half minors of six hours.

The famous *Beilage* of the *Munich Allgemeine Zeitung*, which for a century and more has appeared in large folio form, is now modernized and published in octavo magazine shape. The former editor, Dr. Oskar Bulle, who some months ago had severed his connection with this, the best general scientific journal in Germany, has again become its editor.

Volumes v. and vi. have now appeared of A. C. McClurg & Co.'s "Literature of Libraries in the Seventeenth and Eighteenth Centuries," edited by John Cotton Dana and Henry W. Kent. One of these contains two brief tracts, or letters, of Gabriel Naudé on the dispersion of the Mazarin library, of which he was the learned head. Naudé, that "moralizing skeptic wearing the mask of an erudite," as Sainte-Beuve called him, represented the bookish zeal of the seventeenth century, and he writes with genuine pathos of the threatened dissipation "of this the most beautiful, the best, and the largest library which had ever been brought together in the world, containing, to my own knowledge, more than forty thousand volumes, of which more than twelve thousand were in folio." The book opens with a pleasant sketch of Naudé's life by Ruth Shepard Grannis. The other book contains the "Brief Outline of the History of Libraries," by Justus Lipsius. The translation is by John Cotton Dana. We have before now called attention to the charming appearance of these little volumes.

Four of the excellent reprints of the Malone Society have been sent to us by James Burns & Co. of London. Two are in black letter: "The Interlude of Johan the Evangelist" and "The Interlude of Wealth and

Health," both from copies found in an Irish library in 1906 and bought by the British Museum at £195 and £102, respectively. The originals are followed scrupulously, with the exception of the letters N and U, which are often indistinguishable in the old black letter, and are therefore used by the editors according to their judgment of the sense. In such words as "indicavit" or "iudicavit" each lection gives a meaning. The other two volumes are of later works, one being the "Orlando Furioso," attributed to Robert Greene and reprinted from the British Museum copy of the quarto of 1594, the other being "The Battle of Alcazar," probably by George Peele, reprinted from the British Museum and Dyce copies of the edition of 1594. The editing has been done by W. W. Greg, with the assistance of various hands, and is intended to reproduce the exact form of the original text. The books are a desirable addition to the growing library that is bringing the literature of the sixteenth century into the hands of scholars throughout the world.

A second volume of selections from the Bowdoin-Temple Papers has been issued by the Massachusetts Historical Society. The rehabilitation of John Temple and his appointment as British consul-general is one of the features, and he served in that capacity while Bowdoin, his father-in-law, was Governor of Massachusetts. This connection brings into relief the questions of trade and impressment of seamen which were discussed between the two countries before 1800. The confiscation of Temple's estate during the Revolution was the cause of later proceedings to recover the value, and Shays's Rebellion furnishes an incident connected with the financial disturbance succeeding the war. Of special value is the series of letters from the younger Bowdoin to George W. Erving, when on his futile mission to Spain. It cannot be said that either Bowdoin or Erving makes a good showing in this diplomatic venture, and the ineffectiveness of Monroe is again demonstrated. So few of the personal letters of the men employed in these earlier foreign missions have been printed, and so incomplete is the published selections from their public dispatches, that this volume is doubly valuable. It cannot alter the accepted view of the negotiations with Spain, but it casts much light upon the characters of the negotiators, and on the personal incidents, which, petty as they often were, controlled their conduct. A careful reading of these Bowdoin letters will serve to correct any belief in the charges brought by Erving and adopted by Jackson, that John Quincy Adams was deceived by Spain in the transfer of Florida, or was careless of boundaries in the delicate negotiations which led to the cession. The editing of the volume is a model of impartiality, and is the work of Charles C. Smith.

It is a pleasure to commend "The Italian Lakes," by W. D. McCrackan (L. C. Page & Co.). The author does not content himself with mere descriptions of places and scenery, but by brief accounts, sometimes biographical, of the many famous persons who by residence or travel are associated with the lakes, secures for his book a genuine human interest. Catullus, the two Plinys, Arnold of Brescia, Chevalier Bayard, Bernadino Luini, Lady Mary Wortley Montagu, Goethe, Volta, Donizetti, Manzoni, Garibaldi, Cavour, Ruskin, Giovanni Segantini, and many others who are so widely different in every other regard, come into these pages because they dwelt or sojourned among the most beautiful of inland waters. Passages from the poets in praise of the lakes are also quoted, from Catullus, Virgil, Dante, and the rest, though Mr. McCrackan has overlooked the last lines written by a great poet on this theme, Tennyson's "Row us out from Desenzano, to your Sirmione row." Both inside covers contain the same double-page map of the Italian lake-country. But, although it is quite large enough to include all the important places, some of the towns most prominently treated are not to be found on it, notably Pallanza and Solferino. We have noted a few errors. On page 2 it is said that "the forest trees are *of* chestnut and walnut," etc., as though they were manufactured. On page 4 the architect Bramante is called Brabante, and on page 43 Cardinal de' Medici, Cardinal de Medici. The younger Pliny was imperial legate in Bithynia and Pontus, not "Bithynia and Pontica" (p. 164). The name of the Dante scholar mentioned on p. 286 is Tozer, not Tozier. The word "large-ish," p. 226, is most objectionable. In the Italian inscription quoted on page 312 read *dimorò*, in place of "dimoro."

The Rev. Alexander Robertson, D.D., who writes "Venetian Discourses, Drawn from the History, Art, and Customs of Venice" (Scribners), is a clergyman who has lived long in Venice. His "Discourses" are a combination of history and homily. An example will suffice:

> I have often been asked if the piles of Venice palaces never rot, and so give way and require to be renewed. My answer is, unless something very abnormal happens, never. . . . In like manner, the statements and promises of God's Word never fail the believer.

Dr. Robertson has much information about Venice, and his book is beautifully illustrated; but why should any one wish to take his Venetian history in *sermons*? Algebra, seismography, and other branches of learning are not imparted in religious tabloids; why should Venetian history be?

The year 1891 saw the publication of two valuable Introductions to the Old Testament, that of Professor Driver, in English, and Prof. Carl Cornill's, in German. Driver's work was honored by translation into German by Rothstein in 1896, and G. H. Box, an English vicar and former scholar of St. John's College, Oxford, has now rendered the German treatise into English, with the title "Introduction to the Canonical Books of the Old Testament" (G. P. Putnam's Sons). The translation is made from the fifth revised edition of the German. Like its English counterpart, Professor Cornill's work has won general recognition as a standard manual of study, based on thorough research and marked by real insight into the literary and historical character of the Old Testament documents. Questions of analysis, authorship, and date are naturally prominent, but in this Introduction one is brought further along toward the construction of a religious history of Israel, which is certainly the object of Old Testament study, than is the case in some works of its class. The clearness and conciseness of the original are preserved in the translation, but it is to be regretted that the translator has made reference to previous passages by sections only, which are not noted at the top of the page and are therefore difficult to find in the text.

The universities of France have in recent years produced a series of remarkable monographs on the history of English and other modern literatures; but the latest contribution from this source, Maurice Castelain's "Ben Jonson: l'homme et l'œuvre" (Paris: Hachette), a bulky octavo of 950 pages, only in a measure maintains the high standard of its predecessors. As a critical introduction to Jonson's work for French readers it has real merit, though extended and diluted beyond the needs of the subject; but it adds little to our knowledge of Jonson, it underestimates his power and influence as a lyric poet, and ignores the historical relations of his dramatic and poetic work. M. Castelain has also published a critical edition of the "Discoveries" (Paris: Hachette), in lieu of the Latin dissertation formerly required for the degree of *docteur ès lettres*. The sources of the "Discoveries" are printed at the foot of each page, thus emphasizing Jonson's indebtedness to his classical and continental predecessors; but M. Castelain has himself added little, though something, to the classical sources already indicated in Professor Schelling's edition, and to the borrowings from Heinsius and other continental Latinists pointed out in *Modern Philology*, 1905, ii. 451-460. The book contains no other annotative material.

An excellent translation of Yosaburo Takekoshi's "Japanese Rule in Formosa," with its preface by Baron Shimpei Goto, has been published by Longmans, Green & Co. The Japanese experiment in Formosa is of great interest, now that reports from Korea give a by no means flattering picture of conditions in that captured kingdom. That Japan is being judged as a colonizer is the reason for Mr. Takekoshi's book; and, as it is obvious that he is bent on making as favorable a showing as possible for his beloved country, his conclusions must be accepted with some reserve. It is not, after all, Formosa which will tell the story, but Korea; and decades must elapse before anything like final judgment can be passed. Yet, as we pointed out recently editorially, the story the author tells is altogether favorable to Japan, particularly on the financial side. It really looks as if she would have back all the money spent on Formosa by 1910, something to make Americans jealous, when they think of the millions squandered in the Philippines for which no return seems possible. In such matters as railways and roads, telegraphs and telephones, and sanitation, great progress has been made. Order has been established, so that the proverbial young girl may travel alone, save, of course, in the uncivilized part, where force is now being used to conquer the natives. But it must not be overlooked that the Government has derived no little of its financial success from the opium, salt, and camphor monopolies. It was quick, however, to establish civil rule, and is reported to be bent on a much-needed reform of the courts.

Mr. Takekoshi's book contains an excellent sketch of Formosa's past and a description of the island's geographical features and mineral wealth. The account of the savages is of especial value at this time of conquest. The faithful and intelligent translation is by George Braithwaite of Tokio.

Clovis Hugues, who died the other day, was for many years one of the most indefatigable of French agitators, and a writer of marked ability in both prose and verse. He was born at Ménerbes in 1851, and was educated in the Seminary at Sainte-Garde. It was at first his intention to enter the Church, but he soon renounced the idea of an ecclesiastical career and adopted that of a journalist. He wrote for a succession of newspapers, and in 1871 was arrested and condemned for his work on *La Fraternité* to three years' imprisonment and a fine of 6,000 francs. In 1878 he was tried at Aix for another offence and acquitted, and soon afterward he was elected a representative of the Extreme Left by one of the districts of Marseilles. As a deputy, M. Hugues identified himself with every demand of the extreme Radicals and Socialists. Among his best-known works may be mentioned "La Femme dans son État le plus interessant," "Les Intransigeants," "Poèmes de prison," "Les Jours de combat," "Madame Phaéton," a story of Parisian life, and "Monsieur le Gendarme." He also wrote several theatrical pieces, including "Une Étoile" and "Le Sommeil de Danton." The latter was only played once, but was reviewed very favorably.

THE CATHOLIC ENCYCLOPEDIA.

The Catholic Encyclopedia. An International Work of Reference on the Constitution, Doctrine, Discipline, and History of the Catholic Church. Edited by Charles G. Herbermann, Edward A. Pace, Condé B. Pallen, Thomas J. Shahan, John J. Wynne, assisted by numerous collaborators. In fifteen volumes. Volume I New York: Robert Appleton Co.

This sumptuous volume is well printed, beautifully illustrated, and handsomely bound. The only fault that can be found with its mechanical make-up is the heavily glazed paper, which is a little trying to the eyes. The Encyclopedia is primarily an American enterprise, published with the imprimatur of the Catholic Archbishop of New York, but the contributors are from various lands, and the work bears a genuinely international character. There are something over two hundred contributors to the first volume, of whom more than eighty are foreigners. Canada, England, Ireland, Germany, Austria, France, Switzerland, Belgium, Holland, Spain, Italy, and even Servia, Turkey, India, and New Zealand, are represented, but names from Mexico and South America are noticeably lacking. The general aim of the work is clearly stated in the preface, from which the following passage may be quoted:

> The Catholic Encyclopedia, as its name implies, proposes to give its readers full and authoritative information on the entire cycle of Catholic interests, action, and doctrine. What the Church teaches and has taught; what she has done and is still doing for the highest welfare of mankind; her methods past and present; her struggles, her triumphs, and the achievements of her members, not only for her own immediate benefit but for the broadening and deepening of all true science, literature, and art—all come within the scope of the Catholic Encyclopedia. It differs from the general encyclopædia in omitting facts and information which have no relation to the Church. On the other hand, it is not exclusively a Church encyclopædia, nor is it limited to the ecclesiastical sciences and the doings of churchmen. It records all that Catholics have done, not only in behalf of charity and morals, but also for the intellectual and artistic development of mankind. It chronicles what Catholic artists, educators, poets, scientists, and men of action have achieved in their several provinces.

The Encyclopedia is not meant primarily for scholars, and it contains no elaborate original contributions, such as appear in the "Britannica" or in "Hastings' Bible Dictionary" and in "Cheyne's Encyclopedia Biblica"; but as a work intended to inform the general public on the matters with which it deals, it is excellently adapted to its end. The articles are clear and concise, and as a rule sufficiently elaborate without being loaded down with unimportant details. In the matter of form, in fact, many of them are models of what encyclopædia articles should be. And while they vary greatly in value, as is inevitably the case in any work of the kind, the average is high. As a thesaurus of information touching the rites and ceremonies, the beliefs and practices of the Roman Catholic Church, the work will undoubtedly prove invaluable. In this connection such articles as Abbey, Altar, Ambrosian Liturgy, Appeals, Asceticism; and the exceedingly convenient ones on Abbreviations and Ecclesiastical Addresses, may be particularly referred to. The last closes with the sound advice, "Even, however, with these explanations, which might have been developed at greater length, some difficulty may occasionally occur, in which case it is better to make a free use of titles of respect, rather than to run the risk of not using enough, and of thus falling short of what is due and fitting." Unfortunately, the author of the article Acolyte was not acquainted with Harnack's work on the Minor Orders, which would have kept him from representing the office in the usual way as an extension of the Diaconate.

Roman Catholic doctrine finds clear expression in the articles Adoption, Absolution, Adoration, and many others. In such articles there is considerable mediæval theology, but probably the greatest amount of merely traditional material is to be found in the articles containing the lives of various saints. In some of these commendable reticence is observed, as, for instance, in the article on Saint Agnes, but in others the old legendary tales abound. The length and profusion of detail of many of the biographical articles are an indication of the popular character of the work, but some of them, notably those on the more important popes, are exceedingly well done, the one on the notorious Alexander VI. being a model of sane and careful treatment. Of course the biographical articles are as a rule more sympathetic than in Protestant or secular encylopædias, but the writers do not hesitate to admit the vices and weaknesses of those they describe, on the principle which one of them quotes from Leo XIII., that "The historian of the church has the duty to dissimulate none of the trials that the church has had to suffer from the faults of her children, and even at times from those of her own ministers." The article on the Duke of Alva is an excellent example of the general attitude in this respect. His cruelty and tyranny are set forth frankly, and condemned unsparingly, while on the other hand he is treated with greater fairness than is common in current accounts of his life. Reference may also be made to the brief article on the English Catholic historian Lord Acton, which contains a very just and discriminating estimate of his work.

In addition to matters of specifically Catholic interest, the Encyclopedia deals also with a wide variety of topics, as the passage quoted from the preface might lead us to expect. There are occasional articles on subjects which have no discoverable relation to Catholicism, among them for instance the philosophical one on Æsthetics, and those on Protestant movements and sects, like Arminianism and Adventists. Others, though at first sight entirely secular in character, are rather violently brought into connection with Catholicism. Thus an article on the French Academy finds its justification in the fact that it was founded by a Cardinal and its early members were all Catholics. The medical article Anæsthesia is for the most part such as might appear in any general encyclopædia, but at the close the following practical advice is given for the benefit of Catholics:

> It is important therefore that clergymen should take due precautions by advising the administration of the sacraments before anæsthesia, even though it may be but for a slight operation. Surgeons should warn patients of the risks, even though they are but slight, since the re-assurance from the due performance of Christian duties will usually make the patient more composed and less subject to the influence of shock.

Similarly the article Anatomy is exclusively medical, except for the correction of a misapprehension concerning a papal bull of the fourteenth century relating to the subject. The excellent articles on Agrarianism and Arbitration treat the subjects as any secular encyclopædia might, but in the latter the sympathy of Catholic leaders with the principle of arbitration is briefly shown, and in the former the attitude of the Catholic Church is thus interestingly indicated:

> But though there is discord between revolutionary agrarianism and collectivism, they are alike in opposition to the uniform teaching and tradition of the Catholic Church on the lawfulness of private ownership of income-yielding property whether it be named "land" or "capital." And they are alike in opposition to the idea of all great statesmen from Solon to Leo XIII., namely, flourishing populations of small farmers or peasants.

Abstinence is treated in two articles, the one containing an elaborate historical sketch, and the other discussing its physical effects. In the latter the following passage is perhaps worth quoting:

> The Church has so wisely, and with a foreknowledge of scientific investigation and present proof so accurate as to be almost supernatural, taken all the above mentioned conditions into consideration, in framing her laws regarding Abstinence, that there is not the slightest danger of any physical ills accruing to those to whom these laws apply.

Such an article as this, and the many others on ethical and social questions, are instructive, as showing the wide ramification of Catholic interest and influence, and the degree to which religion enters into all parts of the life of a devout Catholic.

The many elaborate geographical articles also contain a great deal of material suitable to a general encyclopædia, and quite without religious bearing, but the religious conditions of the several places are set forth for the most part in an adequate and satisfactory way. In such articles as Africa, Alabama, and Alaska, it is interesting to see that Protestants are given full credit for their work, and no attempt is made to contrast it unfavorably with that of the Catholics.

Of course, in such a work as this one expects to find all specifically religious questions handled from a Catholic point of view, and one would hardly think of going to it for radical positions upon Biblical or theological matters. At the same time most of its Biblical articles are remarkably fair, stating the modern critical views and giving references to the most important recent literature, Protestant as well as Catholic. One is impressed in reading many other articles besides the Biblical with the large area of common ground shared by Catholics and Protestants. Such articles as Arianism, Apostles' Creed, Apologetics, and Agnosticism might for the most part have come from the pen of an average Protestant; and if less than full justice is done in any case to radical views, Catholicism is not to be particularly blamed for it. The unsatisfactory character of such an article as Arianism, for instance, is not due to prejudice, but to a lack of appreciation of the religious issues involved in the controversy. In fact, the general fairness of the work is one of its most conspicuous merits, and when one considers the temptation to the polemic treatment of many disputed questions, the editors are to be warmly commended for the enlightened spirit which controls at any rate the greater part of the work. It is noteworthy, in view of the modern tendency on the part of Protestant scholars to exhibit their lack of partisanship by avoiding the term "Reformation" in referring to the religious movement of the sixteenth century, to find the phrases "Protestant Reformation," "Continental Reformation," "English Reformers," and the like, used repeatedly and without any qualification in a Catholic encyclopædia.

Another conspicuous merit of the work is the way in which contributors have refrained from indulging in theological speculation and religious phantasy. The long article Angels is a good illustration of this. The subject furnished the Fathers and schoolmen with a capital opportunity for the play of religious imagination, but the article in the encyclopædia is strictly historical, giving the Biblical, patristic, and mediæval views with no attempt to defend the belief in angels, or to make devotional and homiletic use of them. In conclusion, it may be said that though this important work has chief value and significance for Catholics it contains a great deal of interest to every intelligent man, and, so far as it is used by non-Catholics, must contribute to the correcting of erroneous opinions and the breaking down of existing prejudices.

CURRENT FICTION.

The Disciple of a Saint. Being the Imaginary Biography of Ranicro di Landoccio dei Pagliaresi. By Vida D. Scudder. New York: E. P. Dutton & Co.

This historical novel, dealing with the life and times of St. Catherine of Siena, is a noteworthy success in a most difficult form of writing. The hero, Raniero di Landoccio dei Pagliaresi, was actually a disciple of St. Catherine, and the first of her secretaries in point of time. Highly educated, contemplative, and having a decided turn for poetry, he was oppressed by a sense of the political and religious evils of the age. His disposition, in short, was of the Hamlet type. St. Catherine's glowing energy and strength of purpose, interrupted though they often were by her visions and trances, inspired her young disciple with the motive power which in himself he lacked. But being sent in advance of his spiritual mother to Avignon, he comes under the spell of the rationalizing Pagan Revival, which then, just after the death of Petrarch, was at the beginning of its still unended career. By the time that Catherine arrives in the papal city, he is ready to cry out that fourteen centuries of Christianity have been a failure. "Behold the Church!" he says. "The good within her fold are weak; they dream or acquiesce. Only the bad are strong." And of all the forms of God, presented to his inward sight in his moods of poetic exaltation, not one was in the likeness of the Cross.

Catherine sees, hears, and understands. After the departure from Avignon he is healed of a bodily illness by her intercession, and is gradually restored in faith. For his besetting mental ailment, which she calls "confusion of mind," she prescribes work while she lives, and at her death leaves a message bidding him become a hermit. The event proved that her spiritual insight did not fail her in divining the cure he needed. In acts of penitence and devotion, in fasting and prayer, wherein, even more than in his active life, he shared the world's struggles and sorrows, he found a constructive faith and final repose.

At a time when there exists in the Anglican Church a strong Romanizing party, when so eminent a scholar as Professor Briggs concedes many of the Roman claims, it is interesting to observe that the chief preoccupation of the author of this novel is to uphold the main contentions of Catholic doctrine and practice. "Woe to the Church," thus she reports one of Neri's reflections after he has entered into the hermit's life—"woe to the Church when such meditations should cease, when the practice of the presence of God should be forgotten by her children." . . . "He and his comrade contemplatives scattered over Christendom were helping to preserve for the whole race its most precious treasure, to transmit to ages unborn the consciousness of the Transcendent God." Again, we are told that "the earth was to him no finality on the one hand, no illusion on the other, but image or sacrament of the Unseen." Compare with this Newman's statement in the first chapter of the "Apologia":

> The very idea of an analogy between the separate works of God leads to the conclusion that the system which is of less importance [that is, the material universe] is economically or sacramentally connected with the more momentous system, and of this conclusion the theory to which I was inclined as a boy, viz., the unreality of material phenomena, is an ultimate resolution.

In the dialogue, the most difficult part of an historical romance, Miss Scudder has achieved a distinct success. And she has wisely adopted the dramatic rather than the analytic mode of presentation. Her diction, however, is at times decidedly overstrained, especially when she speaks for herself and not through her personages. She has a curious weakness for the archaic use of *him* and *her* as reflexive pronouns, *e. g.*, p. 18, "The part was taken by a boy, who held *him* haughtily." Typographical errors are numerous, especially where Latin and Italian are quoted.

Sketches from Normandy. By Louis Becke. Philadelphia: J. B. Lippincott Co.

Louis Becke is one of the increasing number of writers who have come to literature in middle age or after, by way of an active and even adventurous experience. For many years a trader in the South Seas, at fifty he found himself possessed of a good deal of fresh material, and able to use it effectively in fiction. His breezy, rough-and-ready style is not more journalistic than bookish. It is the style of a good natural talker, who has seen many amusing things in the course of a varied life. He has been called a second Herman Melville; but his flavor is not like that of the author of "Typee"; he is more vivacious, more humorous, less literary. There is an engaging shamelessness in the preface of the present sketches, where he confesses that the grammatical character of the book has been summarily damned by "three clergymen, one barrister, and a lady novelist"; and that therefore he has "thrown himself upon the mercy of his publisher's reader, and has asked him to do his best." That gentleman has, it seems, been wise in not doing his worst; he has had the discretion or the fortune to allow his author certain irregularities which pleasantly distinguish him from the painful bookman. Such a writer is invulnerable because he so cheerfully bares his bosom. Doubtless there is little to be said for these casual and garrulous sketches, except that they are unusually readable.

Needles and Pins. By Justin H. McCarthy. New York: Harper & Bros.

Mr. McCarthy again takes François Villon as his hero; Louis the Eleventh is cast for the villain, with Oliver le Daim and Tristan in the background, and alternate choruses of starving peasants and arrogant nobles. So far, all is according to history and Quentin Durward. But . . .! Novels of this type, even when manufactured with so admirable a skill as Mr. McCarthy's, are hardly pabulum for adults. It takes Mr. Hewlett's talent to write serious historical novels, and Mr. McCarthy does not in the least resemble Mr. Hewlett. Consequently, what extraordinary confusion will arise in the adolescent mind if, after browsing upon this François, it should later meet Mr. Stevenson's more truthful version! Mr. McCarthy's Villon is married to Katharine de Vaucelles, reincarnated as a remarkably disagreeable heiress of high

degree. Under every temptation he remains a peerless husband, and ends by reconquering her affection, in spite of frequently talking like an East Side agitator. In fact, Mr. McCarthy presents Villon in the light of a perfectly monogamous Shelley. Apart from this somewhat trying piece of originality, the book has merit—movement, color, and a sufficiently interesting conception of a fifteenth-century conservative finding herself married to a charming poet, with views on the equality of man. It is not, however, a sociological treatise, but a lively story of cloak and sword, decidedly brisker and worthier of consideration than would be divined from its somewhat trivial title.

The Princess Virginia. By C. N. and A. M. Williamson. New York: McClure, Phillips & Co.

Not to go behind 1840, the prince or princess of a vague kingdom (the kind defined by Stevenson as bounded by the Grand Duchy of Gérolstein and the seaports of Bohemia) may trace their genealogies somewhat thus—Alfred de Musset, George Meredith's "Harry Richmond," Daudet's "Les Rois en Exile," "Prince Otto," "Majesty," by Louis Couperus, "Her Majesty" (by some one else), Zenda (and dynasty), Henry Harland's enchanting "Players All," Anthony Hope's own brilliant "The King's Mirror." Then came what might be termed universal Zenda-and-water, and now the deluge! By this is meant the whole brewing of inexpressibly childish productions, of which "The Princess Virginia" is a fair specimen. No motors in this, but a manner so glib and facile that it resembles nothing so much as the swift revolutions of a new front wheel, when the salesman turns a bicycle upside down and gives a twirl to prove the smooth perfection of its ball-bearings. There is the same near approach to perpetual motion, and the same lack of arriving. There really must be a close season in princesses, for ten long years, or at least till the present mould is broken, and somebody makes a new one by hand.

The Story of a Pathfinder. By P. Deming. Boston: Houghton, Mifflin & Co.

Prefacing a group of sketches which have the reminiscent charm of a generation-old album of photographs, Mr. Deming gives an account of his own career. Born in 1829 in a small New York village, he was lucky enough to discover his bent early in life. As a child he chanced upon a stray pamphlet on stenography, and at once he was "fascinated, snared, and taken." His purpose never wavered until he succeeded in taking satisfactory notes of a legislative debate in Albany, which secured him a regular position. In 1865 he was instrumental in bringing shorthand into the courts, where, up to that time, the records depended upon reports laboriously made out in common writing.

Although written at a much later date, both his stories and preface bear rather the impress of the fifties than of the post-bellum newspaper world. It is the atmosphere of Greeley's Memoirs, with all the mildness and restraint of what might be called the middle Victorian period in American fiction.

Morals in Evolution: A Study in Comparative Ethics. By L. T. Hobhouse. 2 vols. New York: Henry Holt & Co. $5 net.

Whether and how ethical conduct and theory have advanced in the world—this is the question discussed by Mr. Hobhouse; the subject, sufficiently large and complicated, is treated by him in a sane and broad way. Ethics, he holds, is the product of man's experience and reflection—a thoroughly human creation; and human morality is as blind and imperfect as man himself. The central point of ethics is the idea of the good; but the good is not a fixed thing, it is constantly changing in practice, and if an ideal is conceived, it is determined by present conditions and is subject to change. The actual moral conduct of men is based on the whole of human character: on sympathy and antipathy, love and hate, self-abnegation and self-assertion—in a word, on all man's diverse and warring instincts and all customs and institutions and forms of social organization. The author begins his discussion by a sketch of the stages of organization, passing from rudimentary forms (as in the Veddahs of Ceylon and the Yahgans of Tierra del Fuego) to spontaneous growths resting on ties of blood kinship (in clans and tribes), thence to the firmer union controlled by authority (kings), and finally to the conception of citizenship and the modern state; and through those stages he traces the development of the ideas of law and justice, marriage, the position of women, relations between communities (methods of warfare, treatment of prisoners), class relations (slavery, caste, serfdom), property and poverty (provision for the poor). All these points are treated at length, with illustrations from various peoples and periods. The evolution of civilized justice, for example, is followed through early limited punishments, private vengeance, blood feuds—all these without a sense of moral responsibility—to the time when society begins to investigate, at first in a very simple way, and to consider the relation of crime to the public welfare. The fundamental ethical question in this long process is the reconciliation of social duty and personal right, two opposed instincts; and relative harmony is attained only after much clashing and many advances and retrogressions.

The more important part of Mr. Hobhouse's work is the discussion of the growth of ethical theory. While not denying that there may be moral elements in early savage life, he points out that the grounds and sanctions of morality are then almost entirely magical; in a violation of tahoo, for instance, the punishment is magically attached to the act; breaches of custom incur the anger of spirits or gods, and punishment is averted by non-moral means. The conception of supernatural sanctions continues into the higher religions, but in them an ideal of character is established, a good ethical standard is reached, the law of love is announced, as in Buddhism and Christianity, self-seeking is repressed, the socially constructive qualities are emphasized; but the self-abnegation of Buddhism and Christianity, as in the Sermon on the Mount, has been set aside by the necessities of society. Monotheism has been ethically effective in unifying the world and identifying God with the good; but, the author adds, it has raised a perplexing problem of evil, and, what is worse, has introduced the morally pernicious antithesis of natural and supernatural. We may note in passing that Hobhouse appears also to refer to monotheism the asceticism that issues from the conception of the antagonism between flesh and spirit. Monotheism, however, is not always accompanied by asceticism—never in purely Semitic religions, Judaism, Arabian Mohammedanism; only in Indian systems, in forms of Mohammedanism in Persia and Africa affected by India; in Christianity; and perhaps in late Egyptian cults. The origin of asceticism is too large a subject to be considered here, but clearly it is not merely a matter of theistic creed. But to return to Mr. Hobhouse's argument: The break of ethical theory with supernaturalism, which, of course, does not mean a break with religion, is traced by him through certain forms of ethical idealism that arise by reflection on experience (Confucius, Mencius), and through the movement of philosophic analysis of the mind and its conceptions (Plato, Aristotle), to the modern view of the law of nature; that is, the recognition of the claims of personality, and "the conception of Mind in Humanity developing towards a conscious realization of its own powers of growth as the central principle of Ethics." The advance of thought to self-knowledge is paralleled in a general way by the advance of the ethical consciousness to the conviction that it has arisen out of the conditions under which mind evolves. As to how far society will accept and be shaped by this view, Mr. Hobhouse, realizing our ignorance of the laws of mental growth, declines to express an opinion. But, he concludes, if this conception of the dominance of mind in human development be true:

> It is the germ of a religion and an ethics which are as far removed from materialism as from the optimistic teleology of the metaphysician or the half-naïve creeds of the churches. It gives a meaning to human effort as neither the pawn of an overruling Providence nor the sport of blind force. It is a message of hope to the world, of suffering lessened and strife assuaged, not by fleeing from reason to the bosom of faith, but by the increasing rational control of things by that collective wisdom, the εἷς ξυνὸς λόγος, which is all that we directly know of the Divine.

The central point of Mr. Hobhouse's exposition, that human ethics, including all customs, rules, institutions, and ideals, is a creation of the human mind, is fully borne out by experience and reflection. It does not exclude the supposition of a divine element in human life; it only assumes that the divine is known only through its manifestations in the world. This view is not new, nor is there much that can be called positively new in these volumes. But the picture given of human ethical progress, the attempt to show the nature of the progress, which is in theory rather than in practice, the conception of humanity as morally self-centred and self-evolving, and the demonstration of the validity of faith in man—these things are brought out with noteworthy lucidity and force. The criticism of customs and of systems of religion and of ethics is generally sound; the part played by the higher religions in supporting moral rules is recognized. The whole dis-

cussion is marked by good sense, and the careful collection of data will be very useful to the student of ethics.

Garibaldi's Defence of the Roman Republic. By George Macaulay Trevelyan. New York: Longmans, Green & Co. $2 net.

Garibaldi has found eulogists, detractors, and chroniclers by the score, but not until now an historian; his personality was too baffling. In him the Italians of the Risorgimento and their friends in foreign lands could see nothing but the hero; while the few serious historical students who have dealt with him have perhaps deduced too obvious conclusions from the long list of his failures and the inadequacy of his intellectual equipment; as Mr. Trevelyan admits he had the brains of an ox, and often enough showed it. The great merit of this book is that it blends these contrasting aspects into a satisfying historical statement based on careful and minute research, and while a cool critic may think that the note of admiration is at times rather strong, it must also be admitted that the subject is one of great difficulty, and that the author is of the highest competence.

The book divides easily into three parts, and the interest steadily grows, culminating in the last chapters. The early life of Garibaldi, his arrival in Italy during the war of 1848, and the events previous to his reaching Rome in 1849, are first briefly sketched. Then follows a description of the struggle against the French under Oudinot, as to which one general criticism may be urged, that it leaves the reader too much under the impression that the population of Rome was behind Mazzini's republic. There were a few moments of enthusiasm doubtless, but the last struggle was one of a very small body of patriots who were mostly north Italians and foreigners, while the population of Rome was either apathetic or hoping for the success of the French and the return of the Pope. It is in the third part, however, that Mr. Trevelyan is quite at his best, for there the interest is never diverted by political considerations from the human tragedy that haunts the hero's footsteps.

From captured Rome Garibaldi attempted with 4,000 men to fight his way through the peninsula to Venice, where Manin still kept flying the flag of Italian independence. He turned and twisted with guerrilla dexterity through the Apennines as far as S. Marino, where, hemmed in by Austrian columns, his followers laid down their arms. He himself, however, with his wife Anita and a handful of marked men for whom there could be no mercy, made a rush for the coast, seized fishing vessels, and pushed out for Venice. All were caught by the Austrian gunboats or driven ashore, and close to Ravenna Anita Garibaldi died in a sheltering farmhouse. Garibaldi, alone with one follower, escaped, after nearly incredible adventures.

Mr. Trevelyan's work has been so thoroughly done that his details are open to very little criticism. It may be questioned, however, whether the hopeless defence of Rome by the republicans had as great an effect as an example and stimulus for Italian nationalism as is suggested. The waves of patriotism had been lashed into a storm long before the Roman republic was proclaimed, and Cavour's subsequent policy and achievement were not affected by what happened on the Janiculum in the spring of 1849. At page 95 two statements may be queried: that Mazzini would under any circumstances have sent Garibaldi north to help Charles Albert, and that the King of Sardinia denounced the armistice of Salasco for the reasons stated: Charles Albert drew his sword for the Novara campaign for the plain reason that he preferred facing defeat at the hands of Radetzky to a republican revolution at Turin. In several places the statement is made that Louis Napoleon was a Carbonaro; in a strict sense this is highly improbable, and it was always denied by the Emperor and his family. Again, the policy of Louis Napoleon scarcely receives justice, since insufficient allowance is made for the difficulties he labored under in Paris; he was far from a free agent during the first few months of his presidency. Professor Bourgeois's "Rome et Napoleon III.," recently reviewed in our columns, appeared too late doubtless for Mr. Trevelyan to utilize. At page 235 the suggestion that the scaffold was used by the restored Papal Government is altogether misleading; without defending Antonelli's far from admirable administration, one must admit that the scaffold formed no part of his methods. It may also be doubted whether the impression given of the action of the French army of occupation is not unfair; there can be no question but that on the whole Oudinot and the French commanders showed great forbearance and humanity. In the bibliography we miss among capital works the British Parliamentary Papers of 1849 and Helfert's and Gennarelli's accounts of the condition of the Papal States. These blemishes are slight, and as few as one could expect to find in a work of this size. It should be added that the maps are excellent and the illustrations of considerable interest.

One last point remains to be dealt with. The style of the book, although somewhat suggestive of the Meredithian and Swinburnian enthusiasms of half a century ago, is on a very high level. At its best, as in the introductory chapter, it has rhythm, charm, deftness of construction, and elevation. But style of this character, of which emotion of the noblest sort is the inspiration, is difficult to sustain in long-continued historical narrative, if for no better reason than that in the chain of history the golden links are few. It is when he enters into communion with the soul of his hero that Mr. Trevelyan is at his best, and that is to say that he excels at a point where even the greatest historians have failed.

Heinrich Heine: Auch ein Denkmal. Von Adolf Bartels. New York: G. E. Stechert & Co.

It is a matter of regret that the incentive to Bartels's biographical study should have been the proposal to erect a monument to the poet, for in opposing the movement (now practically crowned with success) the historian, usually discerning, has given free rein to his anti-Semitism, and condemned poet and poetry alike. Inflamed at the committee's declaration, "Every German maiden sings his songs, and yet he has no monument in Germany," Bartels forgets that Hauptmann (whose genius he himself has honored in a special volume) and Haeckel signed the call for funds, and frets because four of the committee of nine are Jews and the fifth is the wife of a Jew. In nearly four hundred pages he continues the flaying begun years ago in his "Geschichte der deutschen Literatur." The criticism recalls the appearance of Xanthippus's "Was dünket Euch um Heine?" when, in 1888, an effort was made to provide a monument to the Jewish singer in Germany, except that with Bartels even stronger prejudice pervades every page, from his first regret that the German Government had not compelled Heine to retain his real name, Chajjim Bückeberg, to his closing exhortation, *Los von Heine!—zu Boden mit ihm!* The book presents considerable that is new, but its force lies in the effective summary of Heine's shortcomings, in the vast amount of citations from letters, notes, diaries, stray poems, and newspaper squibs, accusing and convicting the poet of falsehood, immorality, treachery to country and friend, and vanity. It is when Bartels discusses the works of Heine that he runs to greatest excess, and gifted poet and prose writer though he be, he is little likely to gather a following. Unfortunately, as is so often the case with German books, these extensive data are not accompanied by an index.

Beginning with Heine's life, Bartels reviews the various incidents, and finally comes to the conclusion:

> Heine never felt as a German, but always as a Jew. When he calls himself a German, it is either comedy or because, as a Jew composing in the German language, he could not and dared not tear asunder the bond that joined him to German culture. Heine's love of country, also, which frequently appears genuine, is not love for the German Fatherland, but really only Jewish family feeling, which is naturally connected with certain memories of place.

Bartels next considers "Heine the Poet and Maker of His Fame," examining his poems and prose in great detail, and discussing his relation to contemporaries. Taking up his promise made in the Introduction that he would show that Heine was neither a great poet nor the greatest lyrist after Goethe, he charges that Heine wrote many of the publisher's announcements of his works, puffing himself inordinately, and that by such widely read verse as

> Ich bin ein deutscher Dichter,
> Bekannt im deutschen Land,

he created a false impression of his real value. As a matter of fact, Bartels continues, Heine often makes gross blunders (*grobe Schnitzer*) in the use of German; and "at heart German is and remains a strange language to Heine, so far as he learns to master it." There is nothing new in his temperament not found already more highly developed in Byron; he does nothing that Goethe, Tieck, Brentano, and others have not done before him; he is not a poet, but a poet-virtuoso, and "of quite a different kind from our great German lyrists." He is a writer who does not owe a general indebtedness to his predecessors and contemporaries, but who appropriates bodily from their wares. The much-praised sonnet to his mother contains human elements, but is no more poetical than many verses

from mediocre poets. In the "Lorelei" Bartels sees no *lyrischer Kristall*, as do most Germans; he finds the last strophe "quite abominable," and thinks that the idea of a "golden comb" and "golden hair" must appeal especially to a Jew! He praises "Die Grenadiere" and "Belsazer," regarding them, as well as most of Heine's ballads, among the best of his works, but seeing in all of them traces of Herder and the Scottish and English balladists. He places no high value on the "Traumbilder," and thinks that, after all, only as a lyrist is Heine a poet, and that as a lyrist, or rather as a *Liederdichter*, he has reached his highest point, as in "Die Heimkehr." Many of these songs, however, are quite unnatural: "Du schönes Fischermädchen" reminds one of Wilhelm Müller; "Was will die einsame Träne" is "incredibly sentimental and really involuntarily comical"; "Du bist wie eine Blume" has the beauty of simplicity, whereas "Du hast Diamanten und Perlen" is "tolerably amusing, but nevertheless suggestive of Jewish cheek." Whatever Heine's merits as a versifier, Bartels maintains his proposition, "What one is as man, that he is also as poet."

With the proverbial disposition of the German to find the source of everything—if necessary, to dig a well!—Bartels sees in Sterne, Jean Paul, Kerner, Eichendorff, and Washington Irving the *Vorbilder* of the "Harzreise," and regards this work as the "least harmless" of Heine's. The description, however, of the natural scenery is ordinary, and save for the mention of such landmarks as the Brocken, could be as well applied to the Black Forest or Thuringia. "Nordeney" is more prosaic than the "Harzreise," and shows that Heine wished to say something, but had nothing to say. In "Deutschland: Ein Wintermärchen," Heine excels himself in abusing Germany and the Germans. In conclusion, Bartels admits that one cannot expect the Jews to give up Heine, but suggests that if the monument proposed is to be erected, it shall contain the inscription: *Heinrich Heine, Ihrem grossen Dichter und Vorkämpfer, Die deutschen Juden.*

The Golden Treasury of Irish Songs and Lyrics. Edited by Charles Welsh. 2 vols. New York: The Dodge Publishing Co. $2.50.

"Few, but those roses"—Meleager's phrase to describe Sappho's poetry—should be the motto of every anthologist, but it must be admitted that a selection of Irish verse made in the spirit of Palgrave's or Quiller-Couch's work could be contained in a very slim volume. Few people realize how brief is the period open to an Irish anthologist. Meleager, when, in the first century B. C., he wove his "Garland" of Greek poets, could ransack nearly seven centuries for the flowers of Greek lyric. Palgrave, for his two volumes in the Golden Treasury Series, and Quiller-Couch for the Oxford Book of English Verse, ranged over six and a half centuries. The earliest poets in the volumes before us date from the close of the eighteenth century, the best of them from the middle of the nineteenth. From one century's work we cannot expect an anthology that would do Ireland justice.

Half a dozen collections of Irish poetry have already appeared, but none so comprehensive as Mr. Welsh's. The best of its predecessors was the "Treasury of Irish Poetry," by Brooke and Rolleston, published seven years ago. It is about half the size of the present work, and has distinct advantages of arrangement, the poets being placed in groups, chronologically. Mr. Welsh has arranged his poets in strictly alphabetical order. This is to ignore the historical interest that should be added to such a miscellaneous collection, and to obscure for the reader the successive phases of Irish poetry. For instance, the poets of the Irish *Nation*, who wrote patriotic verse hostile to England in the 'forties, should be grouped together. Isolated, they and their problems and grievances are almost unintelligible. The poets of Young Ireland, of whom Mr. Yeats is the central figure, are the hope of Irish poetry of the future. The effect of their movement is lost when they are separated by so many names that have little significance now, and will never retain their place by force of merit. At least one-third of the poems collected here are hardly removed from doggerel, or can only be classed with the thinnest of Tom Moore's.

It is to be observed that, while English anthologists do not scruple to include in their collections Irish poets such as Yeats or Goldsmith or Moore, Irish editors, whose need was greater as their field was more restricted, have shown a proper pride in ignoring all poets not of Irish birth. Mr. Welsh would have done well to go further than his predecessors and to resign to English collectors Oscar Wilde, whose five poems included here do not contain a single allusion to Irish interests, while one of them, "Ave Imperatrix," is a whole-hearted panegyric of England, a false note in pages so full of the griefs of the exile and the patriot. In strong contrast are his mother's (Lady Wilde's) passionate laments for Erin and reproaches against England.

The deepest roots of Irish as of Greek poetry are set in the national sagas, and it is from that fountain of legends of

> Things done long ago and ill done,

that Irish poets must in the future draw their inspiration and allusions, if they are to count as more than imitators, like Wilde, of the English poetic tradition. That was perceived first by Ferguson and Mangan in the middle of the last century, and the poets of Young Ireland are but following their example. The pitfall of mysticism has been indicated to them so often by the critics that it will be sheer perversity on the part of Mr. Yeats and his friends if they let the "smoke of their dreams" obscure from all but a few mystics the essential beauty of their vision. Their task is to interpret those great sagas which most of us know so imperfectly, in such verse that they will become the common property of the world instead of being reserved for a few antiquaries and the moribund traditions of the very aged Irish. Homer and the Greek tragedians made out of the dim figures of the heroic saga, Helen, Achilles, Œdipus, and the rest, "forms more real than living man." That is what the poets who adore the Gaelic tradition must do for Cuchullin and Naisi and Deirdre, that Irish Helen whose precise story is still so vague to most educated readers. As it is, their names in beautiful verse give a slight shock as of a barbarism.

Mr. Welsh might have included more translations from the Irish. He omits that wonderful Aran ballad, "The Grief of a Girl's Heart," whose intensity, even in Lady Gregory's prose translation, makes nearly all the love-songs in these volumes seem thin and pale:

> It is late last night the dog was speaking of you; the snipe was speaking of you in her deep marsh. It is you are the lonely bird through the woods. It was on Sunday I gave my love to you; the Sunday that is last before Easter Sunday. And myself on my knees reading the Passion; and my two eyes giving love to you forever.

Simætha in Theocritus is not more passionate and outspoken. Mr. Welsh should have included also the translation of that "Lament for Ireland," which rises above so much of the Irish poetry of discouragement:

> I do not know of anything under the sky
> That is friendly or favorable to the Gael,
> But only the sea that our need brings us to,
> Or the wind that blows to the harbour
> The ship that is bearing us away from Ireland;
> And there is reason that these are reconciled with us,
> For we increase the sea with our tears,
> And the wandering wind with our sighs.

How different is Irish from English poetic inspiration is shown on every page. England has never needed, like Ireland, and for a time Scotland, to sound the note of defiant grief or display a love of country deepened by a passionate pity for her sorrows. What one misses most in Irish poetry is the true Tyrtæan note. Even the fierce glee over the defeat of the English at Fontenoy, where the Irish fought on the French side—

> On Fontenoy, on Fontenoy, like eagles in the sun,
> With bloody plumes the Irish stand—the field is fought and won—

is still the brief triumph of the outlawed exile, and the griefs of exile, *dura fugæ*, overpower the strain of victory. That impassioned love of a soil so often thankless, a true *mater scvera*, is a thing that even Irish poets have wondered at:

> 'Tis as though her sons for that ungentle mother
> Knew a mother's tenderness, felt a mother's pains.

Ireland may yet have her school of nature poets, but so far the love of country has overpowered the Wordsworthian delight in mere contemplation, just as the most passionate Irish love-songs are addressed, not to individuals, but to Dârk Rosaleen, or the Rose of the World, or some other of the figures by which they signify Erin, the true love of all their longings.

Indiscreet Letters from Peking. Edited by B. L. Putnam Weale. New York: Dodd, Mead & Co. $2 net.

The Truce in the East and Its Aftermath. By B. L. Putnam Weale. New York: The Macmillan Co. $3.50 net.

Why Letters or why Indiscreet is not quite apparent, in spite of the fact that Mr. Weale's story of the Boxer upheaval of 1900 and of the siege of the foreign legations is told in the form of a diary by a supposititious attaché of one of the threatened legations, and contains unpleasant reflections on the wisdom and courage of the leading elder diplomats in face of a tremendous crisis. But after all it is only natural that

the sudden uprising of a traditionally submissive population should have taken the little European colony in Peking by surprise; that something like panic should have resulted; that the young men should have chafed for instant action while the old men found it difficult to abandon at once the roundabout methods of their trade or to forget at once the suspicions and jealousies which in peaceful times it was their business to foment in the capital of the Celestial Empire. As for the device of a participant in and observer of the siege recording the progress of events from day to day, the reader is quite ready to take it at its worth, or, if Mr. Weale positively insists, to let himself be deceived, in view of the interest and unquestionable truth of a vividly dramatic narrative.

Vivid and remarkably good reading the account is almost throughout, although too often the author or editor strives too patently after his effect. Scenes of horror are after all easy enough to depict, and "color" rises almost spontaneously from the very subject. On the other hand, there are passages of gripping description whose success proceeds from their sincere simplicity. Our diplomat has a sympathetic eye for crowds. His picture of a panic-stricken mob of Chinese non-combatants fleeing from the city at the beginning of hostilities, is stirring. Better still, in fact, the best thing in the book, is the vision of another crowd, which the historian, hidden behind some ruined barricade, watches streaming out of the pink walls of the Forbidden City, when the guns of the relief expedition begin to be heard in the capital. He catches perfectly there the despair of a peace-loving people, which, awakening from a temporary obsession of blood madness, feels the terrible retribution of the white man advancing upon them, and flees without great hope of escape. The spoliation of the city is described with no mincing of words; our diplomat's sympathy for the Chinese is equal to the editor's own, as revealed in other books of his, but it is a healthy sympathy, based on a knowledge of the native character and of its great capacities for good if only Europe knew how to utilize them—which, apparently, in 1900, Europe did not.

Are the Powers any wiser in 1907 than they were in 1900? In the "Truce in the East," Mr. Weale is inclined to believe that they are. The Boxer uprising and the Russo-Japanese war have taught them. The volume is a sequel to the author's well-known "Re-Shaping of the Far East" which appeared a year and a half ago; and, because of the very short period it covers, calls for no extended comment. Its topics are still the subject of frequent discussion in the newspapers, though here treated of course with Mr. Weale's usual authority and directness. The peace between Japan and Russia is a truce and not a peace; the Anglo-Japanese alliance is an artifical, though temporarily useful, arrangement and cannot last; Russia is still unbeaten and, restricted to her true element, the solid land, is bound, with the development of railway power instead of seapower, to become stronger than ever in a short time. The natural guarantee for the preservation of the eqilibrium in the East and of peace in Asia is to be found in the up-building of a new and powerful China. Can it be done? The task is a tremendous one, but new forces tending towards the desired result are already at work in the Middle Kingdom. The government, though sluggishly enough, is moving against the extension of extraterritorial jurisdiction, dallying with the crucial problems of coinage and taxation, and building up an army. Among the people, the "China for the Chinese" movement is strong, a native press flourishes, increasing thousands of students are going abroad, and the foreign concession-hunter is being thrown over in favor of national capital and enterprise. In the absence of some unforeseen cataclysm, China may in a score of years prove no mean emulator of Japan. But Mr. Weale ventures on no definite predictions.

Switzerland and Its People. By Clarence Rook. Painted by Effie Jardine. New York: G. P. Putnam's Sons. $6.

The enjoyment of all visiting depends as much on familiarity with the antecedents and quality of the people visited as on the charm of their surroundings. For travellers about to enter Switzerland for the first time, as well as for others who have long sojourned in the "crinkled little corner of Europe," such a want is supplied by this volume of text and pictures. The author, Clarence Rook, loves the "little people squeezed among the mountains" in "the playground of Europe," and he writes so convincingly and with such charm of the wonderful little republic, that the hurried tourist, whose ideas of Switzerland have been formed with his eyes on the mountain tops and his feet in the perfectly appointed hotels, will regard the Swiss with a newly awakened interest after a perusal of this work.

The book is heavy, and a trifle unwieldy, owing to the paper required by the illustrations. But about the text there is nothing heavy. In a style which is both easy and graceful, Mr. Rook introduces his reader to the admirable government and fine characteristics of the sturdy Swiss. He dwells on their patriotism, but does not ignore the fact that as "hosts" to the paying guest they are supreme."

In speaking of the "art of a Government which conceals its art," the writer relates an incident which will appeal to many who know Switzerland. He was dining, he tells us, at a restaurant where he met several of the leading men of a large town. The talk turned upon politics, and the claims of the canton were discussed. "After the argument, one of the foreign guests suggested an appeal to the President. An Englishman, taking his courage in both hands and proclaiming ignorance, asked the name of that President and the question ran round the table, for no one could tell the name of the head of the Government. Finally, a stout burgher was appealed to, but he did not know the name! With admirable tact he called a waiter and put the question. He was the only man in the room who knew the name of the head of the State."

The birth and growth of the Republic, the Completion of the Confederation, the Government of the Swiss, fill four chapters with historical matter. Mr. Rook not only tells of the Swiss celebrities, and there have been many distingulshed sons of this small republic, but he also entertains us with accounts of the noted guests who at one time or another made Switzerland their home. The obvious features of a tour in Switzerland are touched upon but lightly; but with enthusiasm well merited, he dwells upon the winter sunshine and the out-of-door life of the Engadine.

The book is embellished with fifty-five charming colored plates of mountain scenery, painted in winter, spring, and summer by Effie Jardine. There are likewise twenty-four half-tones from photographs taken by G. R. Ballance. Among these latter the upper surface of the clouds seen from the Rochers de Naye, where they hang four thousand feet above Lake Geneva, is an extraordinary reproduction.

The Story of Port Royal. By Ethel Romanes. New York: E. P. Dutton & Co. $5 net.

The reader who turns from discussions concerning the three unities or *vraisemblance* in French tragedy of the seventeenth century to the questions of faith is rewarded by a wealth of material. The writings of Saint François de Sales, the establishment of Congregations like the Oratoire, the efforts of the Jesuits to obtain authority, the struggle of Bossuet and the Gallicans against papal encroachment, his quarrel with Fénelon over Mme. Guyon, the enthusiasts of the Sacred Heart—all these show that the stately age whose literature rejected the *merveilleux chrétien* was teeming with the problems of religion.

Many years ago in his "Port Royal" Sainte-Beuve told in detail the history of the most important of the religious struggles of the age. Everything that could be said was said in that work, the most important single study of the seventeenth century. Mrs. Romanes in her "The Story of Port Royal" has attempted to retell the history of the heroes and heroines of the movement. She is, as her preface states and as the numerous references to contemporary English religious literature testify, one of the Anglican Communion who seeks to multiply the bonds between it and other branches of the universal Catholic Church. The Port Royalists, she feels, were unjustly persecuted as heretics, they are wrongly compared to the Calvinists. Her interests plainly incline her to sympathy for the contemplative life of prayer, which the *solitaires* of Port Royal exemplified, and of which Little Gidding suggests itself as an English parallel. She is therefore naturally led to pass over the technicalities of the strife between Jesuits and Jansenists on efficacious and sufficient grace, and to concentrate her attention on the heroes and martyrs she sees among the Arnauds, the Lemaîtres, the Pascals, and on the dramatic incidents of the *journée du guichet*, or the miracle of the Holy Thorn. The non-technical parts of Sainte-Beuve's work are retold in a spirit of sympathy by one who would perhaps be scarcely fitted to cope with the "Augustinus" or the five propositions, but who has done her own judging in matters wherein her interests lie. Yet we cannot but feel that her conclusions are sometimes over-benevolent and fail to represent the intolerance and sometimes the insincerity of the Jansenists, with whom the name of Port Royal must be bound.

It is to be regretted that Mrs. Romanes did not submit her manuscript to somebody competent to correct her French. "Saint Beuve" is perhaps too frequent in English for the reviewer to take offence at it, and "Forgazzaro" introduces one to another language; but other proper names appear in the variety and incoherence with which, apparently, Shakespeare wrote his autograph. The author is utterly unable to localize an accent, and when she speaks of Pascal's "Nouveaux Expériences" or quotes the sub-title of the Port Royal Logic as "plusieurs observations nouveaux propre à former le jugement," the effect is painful.

The Mirror of the Times: Mir'ât az-Zamân. Edited in facsimile, with Introduction, by J. R. Jewett. University of Chicago Press.

American scholars have so long been wont to think of the great libraries of Europe as the sole repositories of the ancient manuscripts, classical and Oriental, that it is with nothing less than a shock of delighted surprise that we receive from the University of Chicago Press Prof. James Richard Jewett's magnificent facsimile reproduction of manuscript No. 136 of the Landberg collection of Arabic manuscripts belonging to Yale. It may well be a source of profound satisfaction to Morris K. Jesup of this city, to whose enlightened generosity Yale owes this superb collection, to know that his gift has so speedily borne fruit.

The manuscript is the "Mir'ât az-Zamân" or "Mirror of the Times," by Sibt ibn al-Jauzî, and is an annalistic record of the period from 1101 A. D. to 1257, the year of the author's death, or, roughly, the period of the Crusades. Since the author was born in 1186 A. D., it is clear that this is in large measure a contemporaneous record of events, and that the earliest of them antedates the author's birth by only eighty-five years. Moreover, it is expressly stated in the colophon that the copying of this very manuscript was finished January 9, 1592, that is, only 135 years after its author completed the original. Truly, then, this "Mirror" brings us face to face with the "Times." And what times they are! They begin with the year of the Hejira 495, less than a year after the coronation of Baldwin as King of Jerusalem, and include the "period of the growth of the crusading states, the development of the power of Nûr ad-Dîn, the capture of Jerusalem by Saladin, and all the events which followed that terrible blow to the Christian power," even to the sixth Crusade and the sailing for home (in 1254) of St. Louis. The author was brought up in Bagdad, his birthplace, by his mother's father, the celebrated scholar and historian, Ibn al-Jauzi. His work, then, should prove of first-rate importance as affording an intelligent view of the Moslem side of the story of the conflicts of that most fascinating period of mediæval history.

Contrary to common opinion, the work of reading the proofs for a facsimile reproduction is an onerous matter. We congratulate Professor Jewett upon the general success of his undertaking, and cannot refrain from publicly urging upon him the duty of giving us an English version of the "Mirror." The book is dedicated to Theodor Nöldeke of Strassburg. In commenting recently upon the fact that a work upon the Vedas by the Oxford professor of Sanskrit had just been published by Harvard University, Nöldeke remarked: "That is a sign of the times." We can easily imagine that he will repeat that comment when he receives this gift from his old pupil Jewett.

Science.

Nature's Own Gardens. Written and illustrated in color and line by Maud U. Clarke. New York: E. P. Dutton & Co. $6 net.

Miss Clarke prefaces her handsome volume with a quotation from Richard Jefferies: "I do not want change; I want the same old and loved things, the same wild flowers, etc.," and her work might be described as a gossiping account of the wild plants that have formed the burden of English song and nature writing from the days when Chaucer wrote of "these floures white and rede Suche as men callen daysyes" to Kipling's "Buy my English posies." Her record is partly scientific, partly picturesque, partly literary, partly sentimental. It is divided into chapters by the months, and reads as if it had been composed from journals kept for a number of years, which were now, so to speak, melted together and the slag removed.

Her garden is that of the poets as well as of botany, and the pages may be recommended particularly to those who know the names and characters of English flowers from books, but are unfamiliar with them in their actual homes. Such a reader, having in mind, let us say, Wordsworth's "stir" over the small celandine, but not familiar with the plant in its British haunts, will find a peculiar interest and profit in the pages here that tell about the little flower and its ways:

From quite a long time ago, the thought of February always involved the thought of a Celandine, *Ranunculus ficaria,* or Lesser Celandine. Not the bitterly cold February with snow and wicked winds and much frost, but a thawing February, when the ruts grew soft again in the lanes, and heads of moisture hung on all the Blackthorn points on the hedges. . . . The petals of the Lesser Celandine are slightly variable, eight an average number, whereas those of the Greater Celandine do not vary from the four pale yellow ones that characterize the flower. I have seen it looking certainly effective growing out of a mossy stone wall that formed a cottage boundary. The foliage is a very charming gray-green and handsome in shape, often giving the plant an imposing height of eighteen inches or more. . . . I saw it this Spring in such a spot, a shining golden stream of little star flowers that flashed the sunlight from all their glistening points most brilliantly. The "stream" ran round a little hayrick that stood at the bottom of a meadow. Now Celandines like moisture at the root, and sunshine for their faces, and the draining of the land gave them the one, and they took care to grow the southwest side of the rick and claim the other on every day the sun shone. The colony spread on beyond the rick, under a tall, jagged hedge, massing up the sides of the bank or lying mud-stained near the water runnel at the base. The petal of the Celandine has a curious way of whitening as the flower fades, as if the little crown were after all not gold, but silver-gilt.

Such is the manner of the book, personal in tone, colloquial, not always quite exact in the use of language, but fairly entertaining in the mass. The pictures are attractive, and in some cases almost make one see the flower growing in its home. Others, it must be said, are decidedly messy, as are so many of the recent color-plates that aim at impressionistic effect. One sees only a blur of colors.

In connection with the Museum of the Natural Sciences in La Plata, the Argentine Republic has established a faculty which is to devote special attention to research work in anthropology. The head of both the museum and the faculty is the professor of linguistics, Dr. S. Lafone-Quevedo. The chair of anthropology is in charge of Prof. R. Lehmann-Ritsche, that of ethnography is given to Professor Outos, and that of archæology to Professor Torrez.

The death is announced of Dr. M. T. Masters, the distinguished editor of the *Gardeners' Chronicle,* with which magazine he had been associated for forty-one years. He was born in 1833, the son of Alderman Masters, who was an intellectual nurseryman at Canterbury. Dr. Masters wrote a great deal for the *Gardeners' Chronicle* and for the Proceedings and Journals of the Linnæan Society. His best-known book is "Vegetable Teratology."

Drama and Music.

"The Truth" (The Macmillan Company) is the latest of Clyde Fitch's plays to be produced in printed form. It was acted and reviewed so recently in this city that it may be dismissed now with but brief notice. A careful re-reading of it furnishes no reason for modifying the opinion originally expressed that the cleverness of the general idea underlying it, and of the mechanical construction—with its smoothness of action and ingenuity of effective incident—count for little in comparison with its trickiness, its extravagance, and its utter conventionality. Becky Warder's purposeless lies are in no way characteristic, but are simply transparent devices for the production of certain situations preliminary to the final domestic quarrel and the preordained reconciliation. As in so many other of Mr. Fitch's plays, character is moulded to fit the exigencies of theatrical incident, and this fact stands out more clearly in type than it did in the stage representation. The dialogue is smartly, compactly, and naturally written, and, as a rule, lends itself readily to conversational utterance. Of solid literary quality it has very little. Occasionally there is a sentence that glitters, but so does tinsel. That is why so much of this cheap stuff is used in the theatre.

Olga Nethersole is to produce an English version of Paul Hervieu's play, "The Awakening," in the Astor Theatre next January. Later on she is to appear in the original piece, with a French cast, at the Théâtre Bernhardt in Paris.

Charles Fry's performance in London of such parts of "Troilus and Cressida" as could be made tolerable to a modern English audience does not seem to have attained more than a success of curiosity. This was one of the few Shakespearean pieces which Phelps himself did not venture to attempt at Sadler's Wells. For Mr. Fry there was, of course, a special audi-

ence, but apparently he did not succeed in exciting much enthusiasm.

Laurence Irving is about to undertake the responsibilities of management by producing at the Coronet Theatre, in London, on the evening of Monday, June 24, an English version of M. Brieux's "Les Hannetons," which he will call "The Incubus." The play, when produced for a private performance by the Stage Society, had a very favorable reception.

Catulle Mendès has been talking about his project for the establishment of an open-air theatre in the forest of Saint-Germain, where he owns a country seat. He has had the scheme in his mind for a long time, but took no active steps towards its realization, fearing opposition from the municipality. Discovering, however, that the forest belonged, not to the municipality, but to the state, he sought and obtained the requisite permission. The model which he proposes to imitate is an open-air theatre in which Goethe produced some of his plays at Weimar. It is to seat 2,700 spectators, and to be covered over in wet weather. The first production will probably be Musset's "La Coupe et les lèvres," and after that some of the younger dramatists with whose work M. Mendès sympathizes will have their chance.

Complaints are often made that first-class musical entertainments are not well attended. Yet great progress has been made in the last seven or eight decades. Compare, for instance, the crowded audiences at the Philharmonic or the Boston Symphony Orchestra's concerts with the state of affairs in Vienna in Beethoven's time as described by Franz Fridberg:

Beethoven was during thirty years the centre of the musical life in Vienna; here he created his monumental works. But when, near the close of his career, he produced his latest and most glorious creation, the Ninth Symphony, with a large orchestra and chorus and four first-class soloists, the audience was a very small one. We must bear in mind the date. In Beethoven's day, and in the early period of Mendelssohn, there was as yet no real concert public; such a public was formed gradually, after the twenties, and even then, it gave its attention chiefly to the celebrated performers, while classical concerts were then and for many years more shunned. When Nicolai founded the Philharmonic concerts in the forties, he was compelled after a few winters to abandon the enterprise because of insufficient support.

Ferruccio Busoni has accepted the place of director of the Masterschool for Pianists in Vienna, formerly held by Emil Sauer. He has also just issued a book containing, among other things, a number of aphorisms on musical æsthetics.

Gustav Mahler is to be succeeded by Felix Mottl as director of the Hofoper, Vienna.

Alphorns are now used in Switzerland, chiefly to gratify the curiosity of tourists and occasionally for signalling purposes. In former centuries they were also used in church music, as accompaniment to choral singing, especially at Advent and on Christmas night.

The remains of Joseph Haydn are to be transferred from Eisenstadt to Vienna. They will there be placed in the central cemetery between Beethoven and Schubert, with a proper monument.

The German Emperor has contributed $2,000 to the fund for the preservation of the house in Eisenach in which Bach was born.

Art.

THE UMBRIAN EXHIBITION AT PERUGIA.

FLORENCE, May 21.

The Exhibition of Ancient Umbrian Art, to give it once for all its full style, is most attractively displayed in the Palazzo Pubblico at Perugia and does great credit to its organizers. The arrangement in general is strictly geographical, but there has been no rigid segregation by material. Paintings, invariably well lighted and agreeably spaced, are in nearly every room, but in every case there are also smaller exhibits of embroideries, stuffs, metal work, or illuminated manuscripts. These are never large enough to be distracting, serving rather as a rest or diversion from the main quest. If the mural restorations of the Palace are at times uncomfortably garish, this is no fault of the organizers. In general, they have manifested the most fastidious taste, and the show seems quite ideally installed. At any rate, being a large exhibition, it is seen without fatigue, and repeated visits only confirm the sense that the committee has very ably put its best foot forward. It is the only one of four recent regional exhibitions which has been ready on the day of opening. The Upper Tiber valley, too, is now quite at its best, and the exhibition adds a powerful reason for omitting from an Italian trip any other small city rather than Perugia. Mornings and evenings one may observe from the walls those tender gradations from full green through gray to the blue hills and the pale strip of sky between the terrestrial and celestial blue, that we love in the background of Perugino.

The exhibition, or, as we may more idiomatically call it, the Mostra, may be considered from a broader or from a narrower point of view—as a display of what Mediæval and Renaissance Umbria possessed in works of art, or, again, as a representation of what she produced. If the organizers had taken the more exclusive attitude, they would have greatly diminished the interest and significance of the show. In fact, it is a little disquieting to find that one's mind returns not to the strictly Umbrian display, but to certain exhibits which are either not at all or only partially indigenous. There is perhaps no single object that compares in beauty with that marvellous fourteenth-century bishop's crook in silver gilt, from Città di Castello, which is shown in the Cabinetto della Torre. Only study the crocketing, the architectural forms, the two bands of enamel in lapis and emerald, the eager angel with arms raised to support the crook, the imploring bishop before the Virgin and Child within the loop—the figures as spirited as they are exquisite, and you will realize this bit of silversmithing is in a manner an epitome of Gothic art at its best. But can we believe that an Umbrian smith created this marvel, so near the style of Nino Pisano? Nothing among the surely Umbrian metal work permits such a supposition. We have presumably to do with a Florentine work of the highest quality. As much may be said of the delicious ivory Virgin from the Sacred Convent at Assisi. It must be reckoned as one of the finest, as it is also one of the largest figurines of its type, but surely Pisa or Florence again is to be credited with its making. The numerous and fine textiles tell much the same story. The cut velvets have come from or at least through Genoa, the brocades are French or Venetian. The single notable piece of large sculpture, the tinted St. Sebastian boldly cut in wood, which is shown in the Niccolo Alunno room, seems to be the work of some wandering artist from the Marches who had learned his trade at Padua or Ferrara. Again the splendid silverlight altar front from the Cathedral of Città di Castello—a remarkably vivacious combination of the late Byzantine and incipient native sculpture—is of pure Florentine workmanship. It is dated in the twelfth century, but belongs to that ambiguous class which might be of considerably later time. In short, the more severely one narrows his observations to truly Umbrian matters, the more inconsequential the show seems. We hasten to add that it has also a peculiar and undeniable charm the analysis of which will occupy us later.

But the organizers of the Mostra have been wise in adopting a merely geographical criterion. Any other course would have been foolish, for the very good reason that, except as a figment of art history, no such thing as an Umbrian school has existed since Etruscan times. There have been non-Umbrian artists who worked for Umbrian clients, there have been provincial schools at Fabriano, Gubbio, Camerino, Foligno, Perugia, etc., the artists of which were usually sedulous imitators of the painters of Siena and the Marca, but an Umbrian school, in the sense that there is one of Florence, Siena, Venice, or Lombardy, there has never been and never could be. The artistic product has been as diverse as the political vicissitudes of the region. There was nowhere the seriousness or artistic self-consciousness that at Florence kept painting in one arduous ascent towards technical perfection, and at Siena caused a tenacious loyalty to the local tradition, together with a constant attempt to refine upon it. In Umbria no such divine discontent, no such single-minded fealty to a local ideal. Everywhere placid, mediocre craftsmen glad to repeat the approved sentimentalities without change, but equally ready to borrow when the wind blew that way, a leaf from the Sienese, Florentine, or Marchian book, such borrowings being usually made in externals without grasping the spirit of the prototype. When she produced a great artist, as she surely did in Piero della Francesca, Perugino, and Signorelli, Umbria did not know how to support him. Piero and Signorelli virtually became Florentines, and Umbria preserves little of their work. Even Perugino, perhaps the single artist of the first rank whose quality is specifically Umbrian, learned much from Tuscany and found the best market for his talent at Florence. In short, Umbria neither knew how to produce great artists nor yet how to keep the few that Providence vouchsafed her in the face of discouraging circumstances. Without some such ungracious appeal to histori-

cal fact, no proper estimate of the pictures of the so-called Umbrian school here brought together is possible, and much of the invidiousness of these reservations disappears when one notes how thoroughly charming the display is after all.

These Alegretto Nuzis, Matteo da Gualdos, Ottaviano Nellis, Niccolo Alunnos, and the rest were not merely backward, but almost unteachable. Indeed, no one fact more distinctly marks the ultraprovincial quality of the school than its entire incapacity to profit by the splendid examples of Italian art that gradually enriched the Umbrian territory. At Perugia itself, Arnolfo and the Pisani, in the superb fountain before the Cathedral, daily witnessed to the revival of Italian art, and the lesson was wholly vain. At Assisi were collected scores of masterpieces of the Roman, Florentine, and Sienese schools of painting, and for nearly 200 years the Umbrian artists continued to paint as if Giotto had never existed. And when they did reach out they imitated the wrong things. We find Niccolo Alunno, beginning with a delightful variation upon the painting of the Marca, ending with an anxious and unskilful imitation of the most reactionary painter of the period, Carlo Crivelli. And after the great apparition that we call Perugino, involving in a manner the creation of landscape as an art, for a hundred years the Umbrians contentedly mimicked his trivialities, the accidental and unorganic traits of his large achievement. It is evident that only the proverbial surgical operation could effect the entrance of ideas into the artistic Umbrian head.

But ideas never interested them: they dealt in sentiments. And here we approach the solution of our paradox—How can anything so inconsequential as this show be so wholly charming? First of all, its unpretentiousness constitutes a charm. There is no tax upon the visitor. If one excepts Signorelli's St. Sebastian and the Pietà of his school, the lovely Gentile da Fabriano lent by the Museum at Pisa, the Perugino Predella from Città di Castello, nothing requires much of the visitor in the way of understanding and appreciation. One rarely has to make the expenditure of concentrated attention necessary to fix a great impression of art. On the contrary, all the pictures without any pretence of mastery joyously repeat the theme of the graciousness of the Virgin Mother, the winsomeness of the Christ Child, the glamour of adolescence in youthful saints and martyrs, the sweet dignity of old age in bishops and confessors. It is notable that narrative subjects are almost wholly absent. In the Franciscan legend Umbria produced the masterpiece of mediæval story-telling, but never an artist who was capable of realizing it worthily on panel or wall. I do not forget Matteo da Gualdo in an Assisan oratory, nor yet Benedetto Bonfigli in the Palazzo Pubblico at Perugia, but in general these engaging Umbrians seem incapable of the very moderate inventiveness displayed, say, by those minor craftsmen who painted the fronts of Florentine bride chests. And yet our Umbrians, in spite or perhaps because of technical mediocrity, have the grace of childlikeness of an art wholly ingenuous and popular, untouched by theory of any sort, and unspoiled by aristocratic or worldly patronage. In a hundred pictures one may verify the charm of the roadside songs of Italy. As in these *stornelli* and *strambotti* the poetic vein is tenuous and the melody slight and unoriginal, but there it is, authentic, appealing, and infinitely refreshing.

While ruminating on this sweet unreasonableness which characterizes all Umbrian art, good fortune brought me to Assisi and to a great scholar, who has studied his Umbria as no other living man. He assured me that in this devotion to reverie unsupported by reflection or technical accomplishment one might note the Umbrian foible or virtue of humility. The patrons of the region thought slightly enough of the local artists. When a great commission was in hand at Spoleto, for example, they sent for the Florentine Fra Filippo. And similarly the Umbrian artists thought very humbly of themselves. When they had gained skill to present the wistfulness of the Madonna, that sufficed. Ambition, the peculiar pride that usually sustains the artist, was singularly lacking. If they touched the heart by the sincerity of their own emotion and flattered the eye by the naïve use of fresh color, that was enough. The passion for perfection which one finds in almost every other school of Italy never penetrated apparently to the land of St. Francis. These painters, excepting always the great and sordid Perugino, were *poverelli* who produced blithely and without thought for the morrow.

With this key it seems one may indeed unlock the Umbrian heart. And as one passes from hall to hall in the Perugian palace one will see everywhere the indications of a contentment which from the point of view of art one can only regard as sweetly unreasonable, yet which is most enjoyable to one who wisely takes this art simply for what it is. Take the Byzantine Madonna in Hall I. For the stories on the wings the painter has been content to copy some much earlier Byzantine manuscript. In the false and clumsy delineation of the muscles he attaches himself to some barbaric painter, presumably Margaritone da Arezzo. He is a complete reactionary, for the cusped Gothic form of the panel points not to the thirteenth century, with the catalogue, but to the early fourteenth. And yet, as regards sentiment, how perfectly he has realized the then comparatively new type of the affectionate Madonna. The child clasps its mother's neck vehemently. The panel is conceived, in spite of its archaism, in the spirit of the later Sienese. Everywhere we shall find such surprising anticipations. In the neighboring room devoted to the Fabriano school, one may note a Virgin and Child by Francescuccio di Cicco. It bears the date of 1359, and the background is completely repainted. But the Madonna has a shy grace, a wholly personal quality, that carries us forward to the Quattrocento and Gentile da Fabriano. In other words, these Umbrians have after all something that places them in advance of their times, and (had their technical skill answered to their originality of feeling) might have given them universal value, namely, an intimate attitude towards their subjects, a desire to present them in their emotional sincerity and simplicity. They are at once the most backward and the most modern of the early Italian painters.

It is in this delightful low vaulted room containing the pictures of the Fabriano school that one may best grasp the significance of the exhibition. Here is the wonderful Gentile from Pisa, which shows what could be done when a master of this school was artistically quickened by contact with the main current of Italian painting. We may remark in passing that the inconsequential panel which hangs beside it protests against its ambitious attribution to Gentile. Here is the Trecentist, Alegretto Nuzi, to show us how winning and how superficial is this art in its average manifestations. He imitates Simone Memmi, when it is not Ambrogio Lorenzetti. He hardly falls below the spirituality of his Sienese exemplars. His color is a delight. But examine his pictures closely and see how he shirks all the problems in which the Sienese delighted. In the drawing of hair he remains heavy handed. If he has a brocade to paint he spreads the pattern flat across his spineless figures instead of searching lovingly the response of the pattern to the folds.

Or go to the *clou* of the exhibition, the hall in which no less than nine altarpieces by Niccolo Alunno are gathered, and there eliminate the pictures and study the frames. Recall what a solid architectural construction a fine Florentine and Venetian ancona is, and then look at these flimsy tabernacles in which Niccolo sets his wobbling saints. It is all painfully *inachevé*.

One could heartily wish it all back in the churches where its sentiment would count. We hasten to add that students of the Quattrocento will be grateful to the organizers of the Mostra, and to the cities, particularly Foligno, that have lent their treasures. Here is Alunno's earliest signed work, 1462, and perhaps his best, a Madonna with Angels and Saints Francis and Bernardino. It is spread on a generous panel in the Marchian style, and displays above a quivering glory of swallowlike angels' wings. One feels that in the later anconas the compartments are so many straitjackets. They promise a monumental quality which Niccolo never had to give. But at least we may study his entire development in this single room, and if he issues diminished from the survey, he emerges also defined. There were in him velleities of a charming realism, and had he dared to be himself we might have drawn from him, as well as from Bonfigli, Fiorenzo di Lorenzo, and Perugino, our ideal conception of the youth of Renaissance Umbria.

The grim Umbria of the Baglioni appears just once, in Signorelli's Saint Sebastian from Città di Castello. It divulges a whole side of life that the art of the region has sedulously ignored. The saint rises high before a peaceful river valley, while the executioners string their crossbows or launch their bolts with professional zest. High on a cliff to the left is the Arch of Constantine. On a crag to the right over a town is a ruin resembling the Colosseum. A street ascends sharply into the city, and down the road men at arms and an angry throng, in miniature, drag and push the pinioned saint towards the stake. Behind the place of execution knights are tilting. The color is pale, mostly slates and grays, and if this picture were not seriously accredited one would suspect the hand of that extraordinary Signorelli follower who did the Crucifixion of the Accademia, Florence. One can hardly imagine anything at once more documentary and more noble than

this Saint Sebastian. With it one comes back to what we mean by Renaissance painting as one of the finer products of the human intelligence.

Almost as much may be said for the splendid Pietà of Signorelli's school, one of the few real "finds" at the show, which has been unearthed from a private collection. It is an extraordinarily tragic and imaginative picture whose author one would gladly know. Undoubtedly it will be put provisionally into that convenient waste-basket entitled Bartolommeo della Gatta, but it has no convincing analogies with his assured work.

In general, few new pictures have come to light, and the task of an attribution monger will be perfunctory. Among the Perugino school pieces there is some sorting out and redistribution to be done, if the game seems worth the candle.

Among the high pleasures of the Mostra must be reckoned the Perugino predella, from the Church of Santa Maria Nuova at Fano. It is, to begin with, in its original condition, barring a little darkening, and it presents the great landscapist in a delightful unofficial vein. With the great Signorelli, it is the only picture that much enlarges the sum of impressions gained from the Perugian Pinacoteca, which, in passing, has been enlarged, rearranged, and relabelled for the nonce.

A wise visitor will give much time to this permanent exhibit, and perhaps will devote more attention at the Mostra to the embroideries and metal work than to the pictures. In these matters I am inexpert, but anybody can see the beauty of the enamelled chalices belonging to the commune of Perugia, and I can imagine the ecclesiastical embroideries which abound arousing the enthusiasm of the knowing. One may note particularly that needlework in pale blue linen on white, which curiously recalls our own colonial bedcovers. Of wholly extraordinary personal and artistic value are the cerements of St. Francis, presumably used for the transportation of his body to the Basilica in 1230. Waving stripes are picked out by the needle in lapis blue and gold, upon a ground of that crimson which is really the Imperial purple. One may be sure, too, that it is the pious work of Umbrian hands. If we had a scrap as large as this page we should regard it as infinitely precious, and here are four metres of it. As for the grave-clothes of Benedict XI., dating from 1304, many fine textiles are here presented, but only in the case of the embroidery can one have any confidence that the work is Umbrian.

I have perforce omitted much of interest—a small, but welcome, collection of the potteries of Gubbio and Deruta, the early Pintorricchios (one unfinished), from Spello, and that remarkable Perugino banner, virtually a cartoon, of Christ bearing the Cross, which has been, it seems to me, erroneously, attributed to Fiorenzo di Lorenzo. The very important display of illuminated manuscripts of the Umbrian school does not lend itself to treatment in a letter, even if I had the necessary competence. It seems really of greater consequence than the pictures, and I may note that in the Niccolo Alunno room is a miniature signed by that new favorite of the connoisseurs Caporali, to whom apparently what is not Fiorenzo di Lorenzo is now to be relegated. Finally, the collection of Plague banners, mostly from Perugian churches, is of cultural interest. In most cases the Virgin or St. Sebastian intercedes with an angry Christ. Below are The Scythe-bearing Death, as a symbol of the Plague, and heaps of corpses beside a quite recognizable Perugia. These banners were carried during the epidemics that raged in the second half of the Quattrocento. In the same spirit, only a few years ago, the inhabitants of Torre del Greco paraded the Virgin in time of eruption, and Vesuvius, like the pestilence, promptly subsided. M.

Finance.

THE "JULY DISBURSEMENTS."

As the end of June approaches, each year, discussion invariably recurs on the financial markets as to what will be the effect of the mid-year disbursement of interest and coupon money. That this incident in the year's finance is by no means a negligible factor, may be judged from the advertisements by Wall Street banking houses. Ordinarily, at this season, these bankers announce in much detail, and with much display, the special attractions which they are offering to investors. One year it may be long-term bonds; another year (as in 1899) stocks of new industrial companies; in still another, as at present, railway notes with a high rate of interest. There is fashion in investment securities, as well as in dress goods and millinery. Just now, railway stocks appear to be out of vogue; last winter's markets are responsible for that. Some time, no doubt, they will come into fashion again, and then we shall see them offered with the same enthusiasm in the bankers' advertisements at the end of June.

Nor are these July disbursements without actual and considerable influence on financial prices. It is roughly estimated that the interest and dividend payments which fall due in this country around July 1 foot up $150,000,000. Except possibly for the January period, this is the largest of the "coupon days." Habit leads to the very general fixing of such payments, whether quarterly or half-yearly, to begin with the beginning of the year, and July thus receives its share of the disbursements on either basis. The $150,000,000 estimate covers only payments made on Government, State, and city loans, and on securities of well-known corporations; the actual sum distributed to investors would be larger by the amount that is paid at that time on mortgages of various sorts, and on shares of small companies. The fundamental fact, however, is that something like the above amount of capital will be placed in investors' hands not far from July 1; from which the deduction is naturally made that, since these investors had already selected Stock Exchange securities as the repository of their previous stores of capital, they will place in similar securities at least a part of the new capital. In a year of active markets and of general prosperity, such a movement frequently has the effect of raising Stock Exchange prices.

Such expectations are occasionally disappointed; they are expressed somewhat doubtfully this year, and the result cannot fail to be more than usually interesting. With the mass of new securities pressing for sale, and the forced liquidation by unlucky speculators, the movement would be particularly welcome. It is sometimes asked how the "July demand" can fail to materialize, since the fact of the sudden pouring of this new fund into investors' laps is conceded. To explain the seeming inconsistency, the habits of the thrifty members of the community, large capitalists and small, must be examined. Taking the community as a whole, money received from the "July disbursements" will be used, in the main, in four different ways—to make new expenditures, to pay off old debts, to enlarge the capital used in a private business, or to put back into investments. The part reinvested will doubtless be the largest, but it will not go exclusively into Stock Exchange securities. A very considerable portion of it will be put out at loan on real estate mortgages; always a favorite investment of small capitalists, especially at times when, as at present, building operations are very general and the rate of interest on such loans inviting.

It will thus be seen that the Stock Exchange cannot reckon with assurance on the greater part of the $150,000,000. It has been the familiar explanation of the so-called "scarcity of capital," this year, that demand for its use in other directions than the Wall Street money or investment market has been almost unprecedentedly great, and this affects the recipient of a thousand dollars in "July coupon money" quite as much as the recipient of a hundred thousand. The rate of interest offered this month by all sorts of borrowers is an evidence of this; even the New York savings banks, barely one-third of which declared last July as high a rate as 4 per cent. to depositors, will probably all pay as much next month. The trust companies have very generally marked up their rate on current deposit accounts. All such institutions benefit by the higher average yield on their own investments, and can accordingly do better by the people whose money they use. But this general raising of the bid for money, outside of Wall Street, has the natural result of diverting the $150,000,000 from the Stock Exchange.

To these considerations, so far as regards the influence of the "July disbursements" on the stock market, must be added the important influence of wealthy capitalists who anticipate their interest and dividends. A millionaire who knows what will come to him from his investment holdings, on July 1, will not always wait until July to reinvest it. If stocks and bonds are offered at low prices on the market during June, or even in the early spring-time, it is easy for such a capitalist to borrow the requisite purchase-money from his bank, and pay off the loan the ensuing month, with his "July dividends." The probability is that, in this period of anticipating and "discounting" everything, our largest capitalists have adopted this plan on such a scale that the bulk of the July money was frequently reinvested, and sometimes most unwisely, before it was received. Mental allowance for this probability is no doubt made when Wall Street

questions the influence of this year's July disbursements in advancing prices.

Still, the release of this great mass of capital into the market cannot be wholly without result. If it accomplishes nothing else, it should at least relieve the strain on credit through the use of the new resources to pay off debt. It may do much more than this. In 1903, the July interest day arrived at the climax of Wall Street's "rich men's panic." The release of capital seemed to have no effect on the flood of forced liquidation; investment prices continued to go down, until August. When recovery then began, however, it was quick and sharp, and the Stock Exchange soon realized that the blackest days of the July panic were the very days when investors were cautiously reinvesting their July dividends.

Railway Problems (Ginn & Co.) is the fifth volume in a series prepared under the direction of Prof. W. Z. Ripley, who himself edits the present work. Like its predecessors, it is a collection of reprints of articles and decisions, intended primarily to serve as a "case-book" for class use with students of the railway problem. But it is more than this. The selections have been so carefully made, and so well arranged from both the historical and logical point of view, that they furnish by far the most informing body of material available to any one interested in this absorbing question. The historical portion is happily introduced by an excerpt from Charles Francis Adams's classic, "A Chapter of Erie," which is followed by Ida Tarbell's discussion of Standard Oil Rebates. The unique feature is the introduction of a considerable number of Interstate Commerce Commission decisions with illustrative maps, that cover the important principles of their rate decisions, abridged with a view to a ready comprehension of their significant features and to an emphasis of the economic rather than the legal points involved. The new Interstate Commerce Act has a chapter, and foreign railways receive consideration. The book is superior in arrangement and comprehensiveness to the previous collection which Professor Ripley edited, entitled "Trusts, Pools, and Corporations," and is a distinct addition to usable literature on transportation.

The Nation.

NEW YORK, THURSDAY, JUNE 27, 1907.

The Week.

The story that a prominent Georgian, who is easily recognized as John Temple Graves—there being no other Georgian so prominent—offered to Mr. Roosevelt the vote of a Southern State if he would run again, was quickly discredited. So, too, was the assertion that the President promptly said: "By George, I'll take a third term if I can break the solid South." All those who continue to impute to Mr. Roosevelt a desire for another term before 1912 are prevaricators of the worst kind; by rights they should have a shorter and more ugly word applied to them. They run the risk of being classed with certain railroad conspirators and nature fakers. No, only those who wish to injure the President will continue to repeat alleged assertions of his willingness to run again in 1908. What they should do is to boom Mr. Taft as the real heir-apparent to the bad times of 1909 or 1910—if there are any—as well as to the policies of Mr. Roosevelt. They should, moreover, assiduously address themselves to belittling all talk of Charles E. Hughes for President, which one now hears in so many directions and in such unexpected quarters. It is obviously Mr. Hughes's duty to stick to Albany affairs, and we cannot imagine why it is that he should have received telegrams and letters from all over the country congratulating him on his veto of the two-cent fare bill, with its treasonable insinuations that Roosevelt methods are not what they are cracked up to be. If this thing continues, it is quite possible that the President may not himself be able to shape the future of the Republican party—and of the magnitude of that scandal we can scarcely bring ourselves to think.

With a bureau at work in his interest and the endorsement of ex-Senator Chandler, Senator La Follette's Presidential boom is ready for inspection. In one respect it is unique among Republican candidacies in that its chances look very much better in the light of strict logic than in that of practical politics. Says Senator Chandler: "If the Republicans are to nominate a radical candidate on a radical platform, they can find only one man who meets the requirements—that man is La Follette." It is true that he is a Republican, a man who "does things," who has carried through one of the most comprehensive programmes of legislation ever seen in an American State, and who finally has manifested an ability to win Democratic votes which we hardly suppose any other Republican aspirant would pretend to equal. According to definition, he belongs to the Roosevelt type, if ever any man did. Yet he is one of the very last on whom the President's favor is likely to fall. It would not do to have the people talking a few years hence of the "La Follette type," any more than "the Hughes type." Apparently fulfilling every expressed requirement, La Follette still, in the minds of Republican philosophers, bears only the same relation to the ideal Roosevelt candidate that the plucked chicken did to Plato's man.

The reasons for making the Independence League national in scope are explained by Charles A. Walsh, former secretary of the Democratic National Committee, and now one of Hearst's chief supporters. During a recent tour of a dozen or so States he has discovered "general distrust of both old parties," and "in all quarters a demand that the Independence League of New York should extend the organization throughout the United States." These two statements are regarded as parts of one demonstration. The first comes very near being an axiom at present. The people are independent as never before. But, unfortunately, independence is not among those benefits which can best be secured by organized and unanimous action. A hundred voters may be more influential if they band themselves together and agree to vote and act in unison; but they are not more independent. Indeed, the people have been working out for themselves lately a pitifully primitive conception of independence, which consists merely in voting for the best candidates, whoever may have nominated them. But the genuine article, as they are now to be made to realize, at great expense to Mr. Hearst, is equipped with constitution and by-laws.

The discovery by the State Department of an "old statute"—so the dispatch describes it—giving the President power to exclude any products of any foreign state unjustly discriminating against the sale of any American product within its boundaries, is hailed as likely to revolutionize tariff relations between this country and other nations. A useful tariff cudgel is what the experts term it. So it is useful, in the sense that a club in the hands of a policeman or the puller-in of a Bowery clothing store may be. As between gentlemen, weapons of this kind are not in fashion, and though nations may not always behave like gentlemen, in the long run the armed bully is neither popular nor always successful in obtaining what he wants. Originally bestowed to enable the President to retaliate for German discrimination against our meats, this power was speedily forgotten when that dispute was adjusted. It is now to be used against other nations as the President shall determine. Thus we see once more how tariffs are the most perfect means of producing concord and friendly feeling between nations, and what measures of good will grow out of them. So far as the age of the newly-discovered "old" statute—seventeen years—is concerned, if our executive bureaus forget such important measures in so short a period, the need for a highly-paid official whose duty shall be to remind our Secretaries and law officers is obvious. We have long been of the opinion that the States need such a servant of the public. Hundreds of laws go on our statute-books every year only to be forgotten or ignored. Frequently office-holders of great importance serve out their terms and go back to private life with no idea of the powers and duties actually bestowed upon them. In many cases, of course, the mere existence of a law ends an abuse, so that neither the police nor the district attorneys have to think of it again; but in how many hundreds of cases are the statutes or ordinances overlooked? No one would dare estimate the number of those that are hopelessly antiquated.

Americans will note with satisfaction the announcement of our delegation at the Hague Congress, through Gen. Porter, that the United States reserve the right to propose and discuss the limitation of armaments. This does not necessarily mean that this country will surely take a resolute initiative in that matter. It does signify, however, that the United States do not intend to have the whole question foreclosed. Should good opporunity present itself, our delegates will seize it. Any other course would really be ridiculous. Here is the most important question that could come before the Conference, yet a sort of tacit edict has gone forth that it shall not be even mentioned. Grown men could scarcely submit to such a tabu. What they are all thinking about, some of them will insist upon having the liberty to talk about. The brave notice served by Gen. Porter was gratifying proof that the policy of "Hush!" will not intimidate the Americans.

The Georgia Legislature is likely, according to Dr. Jeff Davis, president of the Georgia Industrial Association, to find itself in a dilemma. It is committed to the disfranchisement of the ne-

groes, yet will also be subjected to strong pressure to pass a compulsory education law. How to compel the white children to attend school without teaching all the little negroes likewise, is the problem. Dr. Davis fears that the education of the negroes will speedily bring to naught their disfranchisement. This seems ridiculous, for the simple reason that it is the easiest thing in the world to trick an educated negro out of his ballot, and it is being done pretty much everywhere in the South openly enough. But Dr. Davis's alarm is less interesting than his explanation why a compulsory law would make trouble among the whites. The poor white man, it appears, will not "send his children to school where they come in contact with children who are better off, wear better clothes, and present a better appearance." What the race question has to do with this, we cannot see, but Dr. Davis can. Seriously, it is gratifying to note that the desire for a compulsory school law is growing all over the South. The Columbia, S. C., *State* has for weeks been printing letters from its readers, mostly in favor of compulsory education. A Mr. W. H. Edwards, writing from Chester, S. C., declares that more negro children are going to school in the up-country towns than white, because the latter are haled into the factories. It is, in fact, the factory-owners who, together with the presidents of industrial associations of the Dr. Davis type, are the real stumbling-blocks in the way of the compulsory education laws which the most intelligent Southerners desire.

Labor Commissioner Neill is "surprised," and no wonder, at the strike of the San Francisco telegraphers. Through his efforts, a complete agreement had been reached between the officers of the national union and the managers of the companies, and the positive announcement had been made that there would be no strike. Yet a local organization proceeds to make waste paper of the agreement, and issues a vaunting statement about its intention to carry the issue into politics and "to the very doors of Congress." This is to break down the great justification of labor unions. Employers are willing to treat with them only because they are able to bind their men. If they will not live up to their undertakings, they become not only a nuisance, but cumberers of the ground. Yet we see the International Pressmen, on Friday, deliberately repudiating its five years' agreement with the United Typothetæ of America. It had been entered into after careful inquiry and long negotiations, and was admirably fitted to bring about what both pressmen and employing printers desire above all things—stability in the trade. But the pressmen now contemptuously tear up the signed undertaking of their own chiefs. Whom the gods would destroy, they first make untrustworthy.

It occurred to the Chicago *Record-Herald* to question the leading railroad presidents about the Roosevelt plan of having the Government make a "physical valuation" of the various lines. Three presidents declined to give their views for publication; eight replied in opposition to the plan, while A. J. Earling of the Chicago, Milwaukee and St. Paul favored it, on the ground that "there seems to be a public demand for it," though he thought it would not have "any particular effect." A. B. Stickney of the Great Western was apparently on both sides. He does not "especially favor" valuation by the Government, remarking that it would entail "enormous cost" upon the companies; but, on the other hand, if it were "done thoroughly and conscientiously," it would show that the talk about "water" in railway capitalization is all moonshine. The ground taken by the railway men who are squarely hostile to the President's suggestion is, first, that the result could be nothing but "official guessing," since no two men, and no two committees, would agree on cost, value, or capitalization; secondly, that the figures, even if accurate ones could be obtained, would have nothing to do with the fixing of rates, since the latter depend upon service to the shipper and upon competition. The whole symposium betrays much anxiety on the part of the railway presidents lest continued agitation compel them to go on paying exorbitant interest for the capital they need. This Mr. Roosevelt also deprecated in his Indianapolis speech.

It is cause for rejoicing that Justice Brewer's seventieth birthday finds him in every way able to continue his service on the Supreme Court bench. This he has now graced for seventeen and one-half years, during which time his professional and personal standing has been steadily enhanced. As man and jurist he is held in great respect. Thoroughly imbued with the spirit of the founders of our institutions, and having the principles of the republic at heart, he has conscientiously stood up for them, even when the popular tide was flowing in the other direction. Some of his very best contributions to our noteworthy judicial opinions have, therefore, been views in dissent from those of the majority of the Court. Unlike some of his fellow-members of the Federal judiciary, Justice Brewer has not felt it necessary to hold himself aloof from public life. Thus he has presided over gatherings of lawyers and jurists on various occasions, and given many other evidences of civic spirit, notably in his efforts to dignify and uplift his profession. His appeals to the bar of the country for nobler ideals, for steadfast opposition to the demoralizing commercial tendencies of the present day, and for a higher code of professional ethics will be as gratefully remembered as his clear and able decisions on vital American policies.

That is a very pleasant form of religion for hot weather which Otoman Zar-Adusht Hanish has established at Chicago. Once "an accomplised barber," but now "elector of the sun-worshippers' cult in America," he began his services in Lake Park Avenue, at the convenient hour of 4:27 A. M. About forty followers spent the day in adoring and admiring the light and heat of the sun; they wore flowing robes of many colors, ate figs and nuts, and discussed such cooling topics as: "To-day the Corner Stone of Life Eternal," and "Individualism in Mazdaznan Collectivism." The crowning delight of this heliocentric gathering was an address delivered by "Monseigneur Quisquam." Quis est ille? While these proceedings were taking place on the shore of Lake Michigan, the "Nobles of the Aleppo Temple" were engaged at Boston in a memorial service for their departed comrades. Eight or nine thousand of the nobles were present, and an oration was delivered by John H. Atwood of Kansas, who rejoices in the modest title of "Past Imperial Potentate." At the close of his address, a pleasant surprise awaited the audience. A choir sang "Unfold, Ye Portals Everlasting," whereupon curtains were parted, and, as the report says: "seemingly resting upon golden clouds were posted eight angels, some with golden trumpets and others with harps." The audience was "mute with admiration." Some of the questions put by the Past Imperial Potentate of Boston should be answered by Monseigneur Quisquam of Chicago, such as: "What is beyond?" "When the silver cord is loosed, what will be?" "What is here when the golden bowl is broken" These two societies, representing at once the culture of the East and the refinement of the West, have a great future, and, in Mr. Atwood's words, they will one day "top the mountain ridge."

"We crawled along Friday from one o'clock until three o'clock Saturday, not stopping all night, but our forces were exhausted after being twenty-four hours without food or drink. The thermometer registered 96 degrees; there was a blinding dust, and our lips were cracked and our faces burned." It may be stated that the scene of action is Mongolia; yet the words quoted are not from a volume of Aslatic travels of the early nineteenth century, nor even from an account of a Japanese reconnoitring ex-

pedition in the late war with Russia. The writer is the correspondent of the Paris *Matin*, and he is travelling as a passenger in one of the cars engaged in the Peking-to-Paris automobile race. Amidst the sands of Gobi the motor did what motors have always done, and will continue to do under every sky: it broke down. Thereupon "the sadness of despair seized us. All around there was nothing but sand. The only food was one army biscuit and one chicken." There were only two litres of water, and, of course, no petrol. Five miles from Morristown or two hundred from Mukden; what difference does it make? Man's helplessness, for all his boasted mastery of Nature, appears the same. Thus a Mongolian woman came by, riding a camel, and "we made her understand that we wanted a tow. Her docile camel was harnessed to the car, but the heavy vehicle sank into the sand." It needs no extraordinary imagination to picture various juvenile Mongolian faces peering from behind that very camel's saddle-cloth and calling out derisively, "Get a dromedary." Was there at least the satisfaction of seeing the native mind awed by the ponderous devil-machine? Not at all. A Mongol caravan sighted the stranded travellers, and, cruellest blow of all, "passed heedless of our supplications."

With delightful inconsequence, the Irish Nationalists have announced at Dublin that they have decided to break off all relations with the English Liberals, and to inaugurate a grand and harmonious movement for Home Rule. Not too harmonious, however. Motions to welcome back Messrs. Healy and O'Brien were voted down by large majorities. Those able but perverse gentlemen have not submitted gracefully to the Irish Parliamentary machine, and so they must remain outside the breastworks. This is rather a cruel test of the sincerity of the Dublin convention. Jaundiced observers will be sure to say that what Redmond and his party are after is simply agitation and funds to keep their hold on office secure. And their advertised policy seems fatuous in the extreme. They break with a Prime Minister who has again and again declared himself a convinced Home Ruler, to play into the hands of his rival, who is on record as determined to resist Home Rule to the death. If there is any intelligible strategy in this at all, it must lie in the notion that Ireland can never be happy except when she is miserable. To proclaim her wrongs, vociferously but hopelessly, and to give the Bannerman Government an awful "jar," seem to be the whole of the new policy of the Nationalists. Some say that the Irish would, anyhow, rather have a fight than the fruits of victory. Wherever there is a good-sized row, it will be found that, as at the battle in France, *nos Irlandais s'y distinguèrent.*

Signs of appeasement among the wine-growers of Southern France are reported. On Saturday the Chamber passed a prevention of frauds bill. Sunday's visit of Marcelin Albert *chez* M. Clemenceau, dramatic or Tarasconian as one may choose to call it, should do much to hasten the reconciliation between a stern but reasonable Government and a repentant Midi. The leader of the rebellious South is stated to have shed tears of repentance within the Ministry of the Interior. The Minister of the Interior and Premier is said to have bidden his visitor go in peace, in obedience to the laws of hospitality. No more striking scene could have been devised to move the Meridional heart and imagination. Legislative concessions at this late day would be insufficient. That the manufacture of wine out of sugar or the residues of fruit should be forbidden under penalty of a fine ranging from 500 to 10,000 francs, and from six days' to six months' imprisonment, and strict regulations as to the sales of sugar be established, is something. But with the shedding of blood in the streets of Narbonne, the question has become as much one of embittered feelings as of hostile interests. Will M. Clemenceau succeed in enforcing order before entering upon a policy of broad concession? Repeatedly during his term of office he has shown his capacity for doing so.

The movement for a greater Berlin is due not merely to a desire for a big city or for better communication with the suburbs. It is partly an expression of a wish to develop the city æsthetically. Thus the two architectural societies of Berlin have published an appeal for the inclusion of the twenty-five suburbs and villages near by, on the ground that if this is not done the capital cannot grow in a uniform way. At present the suburban towns have their own building regulations, and these are taken advantage of by persons who are anticipating the time when the city will incorporate the villages. What the architects want is a comprehensive and far-sighted plan for the development of the city during the next twenty or thirty years. This would, of course, be a characteristically Continental policy. It leaves scope for individuality, yet it makes impossible such contrasts as render our American cities the wonder of foreign visitors. But the architects want more than uniformity in building: they desire to obtain by competition the very best plan for the landscape development of the future city, with its parks, its shaded avenues, its circular boulevards, and its railway communications all marked out decades in advance. In brief, they want to Haussmannize Berlin after the manner of Paris, or as we Americans now proudly say, to imitate the Burnham way of planning for the Washington of the future.

The declaration to the people issued by the Russian Social Revolutionists contains the following familiar sentence: "The Government dissolved the Duma because it needs an obedient Duma which will support the interests of the aristocrats." Practically this has been avowed by the ministry, if for "aristocrats" we substitute "land-owners"; and therein the autocracy has committed as fatal a blunder as any in its long list of errors and sins of the last three years. Whatever real justification the Government may have possessed against the liberal elements, it could derive only from its vaunted rôle of sole champion of the peasants, that vast silent majority of which we hear so much. At least there was some appearance of reason, when the Government argued that the Jew must not be emancipated lest he devour the helpless *mujik;* the Armenian and the Celt and the Lett and Pole must be kept down lest they destroy the political fabric built up by the same Russian *mujik.* In other words, the broad backs of eighty-five million peasants were, for a time at least, still solid foundation enough for the support of the throne. But when the Government, by partially or completely disfranchising the peasant, deliberately cuts away its own historic underpinning, and attempts to build on a new and narrow foundation of landlordism, it is apparent that the task of the revolutionists must be greatly facilitated.

We have got out of the habit of thinking of Portugal as a country prone to revolutions. It would almost seem, too, as if King Carlos and his Prime Minister had also forgotten their national history. Otherwise, they could scarcely have expected that their attempt to govern without a Parliament would not provoke such bloody outbreaks as those in Lisbon. The world has seen many attempts to rule "by decree," as it is now sought to rule the Portuguese. Some of them have succeeded. Bismarck carried the thing through for a time in Prussia, but he had a compact and powerful military organization behind him; and even for Bismarck the process involved great hazard. He himself said that, if he had failed, he would have paid the penalty with his life. King Charles of England made a similar effort to get on without a Parliament; but as Lincoln said, when that Constitutional struggle was cited to him, he didn't know much about English history, but he was very clear that, somehow, the King lost his head. The King of Portugal is aware that his name in English would be spelled Charles.

UPHOLDING LAW AND ORDER.

By an odd coincidence, two political Radicals in office, John Morley in England, and Georges Clemenceau in France, have lately been at the same time applying the most rigid means within the power of the Government to put down violent attacks upon the constituted authorities. Clemenceau's fate, in this particular, has seemed peculiarly malign. Having made his career as a man of the most popular sympathies, advanced and even Socialistic in his creed, a vigorous writer in behalf of the rights of the people, and a flaming orator against oppression, his Ministry has been one long succession of riotous outbreaks by strikers and of stern repression by his orders. The coal-miners of the North, the bakers and municipal electricians and others in Paris, finally the hot-blooded children of the Midi—all have found their former *compagnon*, Clemenceau, as hard as iron to the appeals of disturbers of the peace, and ready to employ the last soldier of the republic to maintain order. It probably will be the political death of Clemenceau, sooner or later; but he has stood to his task with admirable courage and firmness.

Across the Channel, John Morley's difficulty has been, if not so serious, yet not unlike in principle. It was again the case of a philosophic radical called to actual power and, when confronted with sedition, putting it down as relentlessly as any autocrat. As Secretary for India, Mr. Morley had to face in the Northwest a condition which was one of acute incitement to riot, and, in a few cases, of overt acts of violence. Without hesitation, this disciple of Mill, this biographer of Rousseau and Cobden, utilized the most stringent means within his power to make an example of the offenders and to restore security to the troubled districts. He even resorted to an old and long-unused power, and, by administrative order, and without a trial, sent out of the country the ringleader in sedition, Lala Rajpat Rai. And this course, which superficially appears so much like the *lettre de cachet* or the methods of a Russian chief of police, Mr. Morley, the Radical, defended in the Commons with the utmost coolness. He simply spoke with convincing earnestness of his overwhelming sense of responsibility, to the people of India and of England alike, for the preservation of order, and of his determination to uphold it at all hazards. When questioned sharply as to the evidence upon which he had proceeded, he squarely refused to give it to the House, on the ground that it would be prejudicial to the public interest, and said proudly: "I must really ask my honorable friend to accept it from me that I am very unlikely to make statements on the floor of this House without having provided myself with fair and reasonable confirmation."

The two instances—Clemenceau and Morley—fall very happily together to show that the instinct for political order is strengthening. Let freedom broaden as it may, still there is the fundamental rule of all discussion and all theorizing and all experimentation, that the peace must be kept. That is the only way in which the game can be fairly played. Those who are beaten must take their defeat in as good part as possible, and hope for better luck next time; they must not be allowed to smash the windows and break up the furniture. And Governments are more and more perceiving it to be one of their prime duties to act as an umpire, with the police at his back, to see to it that even political agitation shall be done decently and in order. The flamboyant Clemenceau is in this at one with the cold and critical Morley.

It is scarcely necessary to point out that this principle of holding everybody to the weapons and rules of peace cries out peculiarly for enforcement in the realm of labor troubles. Offences of that kind are bound to come in our modern industrialism. With workingmen increasing in mass and in consciousness of power, it was inevitable that they should combine and endeavor to better themselves. No one objects to that. But the root conception of all social order, as of all government, must not be cut through in the act. Let labor unions do what they please, so long as it be peaceable and not destructive of the rights of other laboring men; but let it be understood that they take to open rioting or secret outrages at their peril. Fortunately, in this sphere, too, executives are everywhere showing that they bear not the sword in vain. This country has had its lesson in both kinds. We have seen the unchecked Pittsburgh riots; and we have seen, on the other hand, a Gov. Rusk and a Gov. Flower turning the military force of the State against lawless strikers; and we are well persuaded which is the more excellent way.

Right here lies the chief significance of the great trial at Boisé. It is intended, primarily, to determine who was guilty of a particular murder; but looming over all is the issue of organized lawlessness within the State. If a body of men, under whatever name, professing whatever aim, can defy the laws, and substitute the bludgeon and poison and the bomb for argument and votes, then it is high time for the authorities to exert their full power to bring them to book. If the Western Federation of Miners has done one-tenth of the things alleged in the evidence at Boisé, it should feel the hand of the Government upon it as heavy as any rioter in India or revolutionary in the Midi.

MENDING THE LORDS.

Campbell-Bannerman's long-expected resolution, looking towards a curtailment of the powers of the House of Lords, was introduced in the Commons on Monday. He has spoken of it as only a "preface to a volume." By that he meant that his resolution would be followed up, in due time, by a bill; and that, if the Lords did not show themselves amenable to mild pressure, sterner measures would be resorted to, and, finally, an appeal taken to the country on the sole and direct issue between the Commons and the Upper Chamber.

All this is certainly very moderate. It accords with the Premier's cautious Scotch nature. He is averse to doing too much thundering in the index. It is a question, however, whether his party does not need just now a little more thundering. The dispatches report dissatisfaction among the militant Liberals and the Radicals, though they will, of course, support the Prime Minister. They would have preferred, it is clear, a louder battle-cry. The initial step of Sir Henry is too tentative and uncertain to please them. All the machinery which he proposes for a conference between the two Houses, on bills in dispute, with references back and repassing, seems to them cumbrous and slow. In their present state of disappointment and impaired prestige, they would have hailed a fighting leadership; and many of them will doubtless be tempted to say, in the reputed words of Bishop Atterbury, that stout Jacobite who wanted himself to proclaim James III. at Charing Cross: "Here is the finest cause in Europe lost for want of spirit."

Few thoughtful and impartial Englishmen deny that the House of Lords is in need of reform of some kind. Proposals to create life peers have come from the side of the Conservatives themselves. Lord Newton brought forward in the gilded chamber itself, only a few weeks ago, a plan to introduce fresh blood and make the Lords a more tolerable legislative assembly. At present it is, confessedly, not that. It is even more true to-day than it was when Bagehot wrote, that "the House of Lords on most days looks so unlike what it ought to be, that most people will not believe it is what it ought to be." That is, a handful of peers dawdle in; the Chancellor takes his seat on the woolsack at 4:45; a bill or two is droned through; a question or two is asked of the Government; and at 5:15 the House rises. This is not a travesty of the ordinary legislative record of the Lords. While the Commons are working, the Lords are idling. It is only on great occasions, critical divisions, that the whips gather in the peers to a real debate and an actual vote. Then they come trooping in from every corner of Europe, many of them actually unknown by

sight to the doorkeepers of the House. One of these officials stopped a noble lord, at the time when Gladstone's Irish bill was to be thrown out, and when, to get a great majority, the preserves and watering places were combed fine, and asked him, "Are you a peer?" The answer illustrated the view taken of high legislative functions by too many charged with them. It was: "Do you think that, if I was not, I would come to this d——d hole?"

It was this spectacle of neglect and inefficiency that most appalled Bagehot. He thought the Lords were less in danger of "rough destruction" than of "inward decay." His prediction was:

> If most of its members neglect their duties; if all its members continue to be of one class, and that not quite the best; if its doors are shut against genius that cannot found a family and ability which has not five thousand a year—its power will be less year by year, and at last be gone, as so much kingly power is gone, no one knows how. Its danger is not assassination, but atrophy; not abolition, but decline.

But, in recent times, the Lords have added gross partisanship to laziness and disregard of duty as a real revising Chamber. For at least twenty years, the House of Lords has been nothing but an annex of the Conservative party. When the latter is in power, the Lords abdicate their functions. They accept obediently whatever legislation the Commons may send up. It is only Liberal bills that they feel it a duty to scrutinize, to amend, or to reject. Thus any Liberal Government exists only on sufferance. In its large measures of legislation, it is at the mercy of the Lords. This humiliating and irritating state of things has been more pronounced in recent years than ever. Mr. Balfour tells the Lords how to vote on all important bills. He almost openly uses the Upper House as a mere pawn in party warfare. Indeed, he boasts of the power he has, through the Lords, to checkmate a Liberal Ministry. At the great Unionist demonstration in Queen's Hall the other day, he said: "Our strength, if it be small in the House of Commons, is great elsewhere." Everybody knew what he meant by "elsewhere"—the House of Lords, where the Unionists count on the acquiescence of their puppets. And Lord Lansdowne said arrogantly in a speech on the land-reform bill, "We will not permit" so and so, meaning that the Lords would thwart the Commons, even though the latter spoke in overwhelming voice both for itself and the nation. It is this sort of intolerably partisan use of one House of Parliament which the Prime Minister denounced yesterday, and against it proposed to set a Constitutional and electoral agitation at work.

Success, if it come at all, will not be attained by waging the contest merely on abstract principle. General talk about the abuse of the bicameral system, or the need of a revising body, will not move Englishmen. They need some tangible grievance, some gross injustice, to stir their blood; and unless the Liberals produce one, nothing will be done. If, however, the Lords, in some pitch of haughtiness, should reject a bill on which the mass of the people had set their hearts, then, indeed, Campbell-Bannerman could go out and set the heather on fire. But till such an opportunity comes, he and his party will probably go on marking time.

THE NEWFOUNDLAND QUESTION.

It appears that no sooner is our Japanese "war" over than we are to have one with England. Sensible people will expect it to be equally bloodless—though, unhappily, not inkless. That the London *Standard* should even hint at the possibility of hostilities growing out of the dispute over the Newfoundland fisheries, is one sign more that a part of the press is not yet civilized. When two men who have got beyond the barbarian stage have differences, they do not fall to clubbing and shooting, but look for some means of friendly adjustment, or settlement in a court of justice. So will nations also act, if they do not wish to be called savage; and the habit of some newspapers recklessly to suggest war shows that Shelley did not make his statement complete. He called war "the statesman's game," as well as "the priest's delight, the lawyer's jest, the hired assassin's trade," but he did not foresee that it might become the amusement of the sensational journalist in a dull season.

The controversy is undoubtedly important. This is because very grave questions of international law are involved. The proper interpretation of the Treaty of 1818 is concerned, as is also the question whether American fishermen in Newfoundland waters are subject to the local jurisdiction, together with the further question of the true relation of the British Government to a self-governing colony. Thus it is not, as some appear to suppose, a wretched quarrel about a parcel of frozen herring. The practical issues at stake are trifling. Looking merely at the real value of the fisheries, it would be better that the whole should be surrendered by either country than that the fearful destruction of war should be hazarded. This is the position consistently taken by Sir Robert Bond, Premier of Newfoundland. In his speech in London, the other day, before the West Indian Club, he said that if it was all a mere squabble about a few fish, neither he nor his Government would have anything to do with it. But there was a great Constitutional question involved, affecting every colony in the Empire. "To put it briefly, the American Government had taken the position that they were not amenable to the municipal laws of Newfoundland when they came within the jurisdiction of the colony to exercise their privileges under treaty. He and his Government had protested in the strongest terms against the admission of that principle, but he regretted to say that last year the colony was not upheld in its demand."

The history of this thorny question has been subjected to minute analysis by Judge Thomas Hodgins of Canada, in the last *Contemporary*. By the citations he there makes from the official correspondence of the United States Department of State and the British Foreign Office, it becomes clear that the attitude of neither Government has been entirely consistent. No Secretary on either side has, of course, ever admitted that there could be any doubt of our right, under the Treaty, "to take fish of every kind" in certain defined parts of Newfoundland waters. But are our fishermen, when in those waters, subject to the colonial laws? For years, the English Government maintained, and ours admitted, that they were. Secretary Marcy in 1856, writing of "certain acts" of Colonial Legislatures, said that it was "reasonable and desirable that both the United States and British fishermen should pay a like respect to such laws"; and, accordingly, he stated that "the observance of them is enforced upon the citizens of the United States." In 1870 our Secretary of the Treasury took a similar position. Secretary Bayard, in 1886, assured the British Government that "everything will be done by the United States to cause their citizens, engaged in fishing, . . . to prevent an infraction of the fishery laws of the British Provinces."

A different line, however, was taken by Secretary Evarts at the time of the Fortune Bay disturbances in 1878, and has since been followed by Secretary Root. Their position, which they argue with great astuteness, is that the Treaty of 1818 grants absolute and sweeping rights with which the local jurisdiction can in no way whatever interfere. They contest stoutly the authority of Newfoundland to make any fishing regulations which shall be binding upon American fishermen in Newfoundland waters. Even the Sunday laws, our two Secretaries set at defiance. Mr. Evarts denied roundly that "our fishing fleet is subject to the Sunday laws of Newfoundland"; and Mr. Root has declared that "the Government of the United States cannot recognize the authority of Great Britain to determine whether American citizens shall fish on Sunday." He bases this upon his doctrine that the Treaty granted "a perpetual right," the exercise of which "this Government cannot permit to be subject to the will of the colony of Newfoundland." On the

similar stand of Mr. Evarts, Hall's "International Law" said in its fifth edition: "It was contended that the simple grant to foreign subjects of a right to enjoy certain national property, in common with the subjects of the state, carried with it, by implication, an entire surrender, in so far as such national property was concerned, of one of the highest rights of sovereignty, viz., the right of legislation. That the American Government should have put forward such a claim is scarcely intelligible." The present difficulty between Newfoundland and the Home Government arose when the Foreign Office departed from its own precedents and suspended the application of local laws to American fishermen, pending an adjustment of the whole question by a new treaty. Meanwhile, a *modus vivendi* was agreed upon, which it is now proposed to extend for another year.

The points in debate are nice ones, plainly. Jurists and statesmen have differed upon the law governing in the affair. But this makes the case precisely of the kind which it has been agreed to refer to the Hague Tribunal, in the event that the parties could not come to an amicable adjustment. Secretary Root would be the first to urge a submission of our claims to that Tribunal, before proceeding to extremities, or even to threats; so that the talk of war growing out of the Newfoundland dispute is preposterous nonsense.

PRESIDENT WILSON'S REFORMS.

The President of Princeton University is not content with raising large sums of money for his institution and erecting many new buildings. He has an altogether praiseworthy desire to try new educational experiments based on experience in other countries. Two years ago he introduced, with very little fuss and feathers, the preceptorial system; that is, he employed a large number of young instructors to supervise the work of the students and generally interest them in their studies. With this system still in the experimental stage, Mr. Wilson boldly tackles the problem of undergraduate societies, from which many a college president has recoiled in dismay, and announces his plan to establish quadrangles, that is, little self-contained colleges within the university, after the manner of Oxford and Cambridge.

President Wilson would not, of course, claim any originality for his latest undertaking. More than twelve years ago President Eliot suggested that the manifold problems which have come with the growth and prosperity of our American universities might be solved by building up colleges within each university. At least, he said, the experiment was worth trying, and it was with this idea in mind that he endeavored to bring about the removal to Harvard of Tufts College, that little institution which flourishes within sight of the tower of Memorial Hall. So in the negotiations with the Massachusetts Institute of Technology he wished the Institute to have its own grounds, and retain so far as possible its own identity after amalgamation with the Lawrence Scientific School. Now it appears that Princeton is to be the first to try the experiment, and not by inducing smaller institutions to affiliate with it, but by developing quadrangles of dormitories in which undergraduates "shall eat as well as lodge, and in which they shall, under the direction of a member of the faculty, regulate their own corporate life by some simple method of self-government." As in the English universities, there is to be a common living room and dining hall, and men of all four classes are to reside together.

This is obviously a blow at the college class system, which is already tottering at Harvard, and can hardly be said to exist at the University of Chicago. The real objective of President Wilson's plan is, frankly, to bring faculty and students into close connection and bind the whole university together by that common consciousness which comes from close social contact, and "to rid the university of combinations, cliques, and social organizations." It is a purer and better democracy that he desires, as well as the restoration of that personal influence of teacher over student so very valuable, and yet now so nearly lost at our larger universities. In this aim everybody who believes in the democratic mission of our colleges and their great equalizing influence must sympathize with Mr. Wilson. It has been quite serious enough to see class distinctions arising in all parts of the country by reason of wealth, or for other causes. If such tendencies cannot be checked at our colleges, if our universities are merely to reproduce within their walls the glaring contrasts between great wealth and extreme poverty, then it is indeed time for serious counsel. The dangers are apparent enough in our rich Eastern colleges, and are beginning to be felt in the Western. Hence the immediate need of such experimenting as Princeton is to undertake.

Confirmation of this is found in the fact that the University of Wisconsin, one of the very best of our State institutions, is also bent on building up a residential life by means of halls, with their own dining rooms and commons. But instead of turning to the quadrangle, President Van Hise, as John Corbin points out in the current *Saturday Evening Post*, is planning a long series of halls around a single large yard or campus. That is, however, of less importance than Wisconsin's discovery that even in one of the most democratic of our universities the influence of fraternities is wholly undemocratic. They claim, of course, to select only representative men, but, as Mr. Corbin says, "the line between the fraternity and non-fraternity elements is sharp, and the strife keen." Inevitably, there are jealousies and ill-feeling, for, aside from the hurts which invariably follow the drawing of any lines, it is obvious that, among 2,000, "many good fellows and potentially good athletes are never discovered." The evil permeates all our colleges. There are protests against it at Yale; at Harvard the club evil is, perhaps, most serious, and the Harvard Union is a partially successful effort to grapple with it by giving a club to all. But faculty and president, corporation and overseers, make no headway against it, while the erection of costly and luxurious dormitories intensifies the evil, as have the expensive club or chapter houses at Princeton and Williams.

It would be idle to affirm that President Wilson's plan is a cure-all. The quadrangle plan has obvious weaknesses, against which measures would soon have to be taken. Thus, if residence is to be secured by election by those living in each quadrangle, these sub-colleges might merely reproduce the chapter-house evils on a larger scale. But Mr. Wilson's protest is heartily to be acclaimed, none the less. If our young Americans are to get the greatest benefits from college life, it will be because they stand on their own merits in the multitude in which they find themselves, and not because the weak or the partially developed find shelter or shielding within a charmed circle of a couple of dozen of their own kind.

THE NEW BOSTON MUSEUM.

The long-expected plans of the Boston Museum of Fine Arts have now been published. The trustees judiciously took their time. To create a new type of art museum is a work that cannot be done overnight. Five years have been spent in the attempt to develop, through comparative study and scientific investigations, a museum which shall be cognizant of every tradition, and yet independent of all. A set of thorough and brilliantly simple designs is the outcome. The architectural and engineering problems involved in a great popular art museum have, for the first time, apparently, been studied from every conceivable angle. From the conscientiousness of the trustees of the museum in Boston, other American communities will benefit; for such a project, assumed by competent professional architects in cooperation with intelligent amateurs, necessarily sets a standard for emulation, if not for imitation.

Just how adequate a solution has been reached, by the architect of the Museum of Fine Arts, of the primary problems

of segregation of departments, separation of collections into "exhibition series" and "study series," the free circulation of crowds, and the proper lighting of exhibits, is doubtless to be proved only by use. The new museum, at all events, based upon what has come to be known as "the Boston idea," will not fail through being illogical. A rotunda on the main floor, reached directly by an easy ascent from the entrance, is the architectural *clou* of the plan. All the larger circuits include it. Lesser circuits make possible a complete survey of any single department without setting foot in any other. Beneath each series of galleries, on the main or upper floor, and connected by staircases and elevator service, is the corresponding series of study-rooms and storerooms. The design throughout is logical; it seemingly should be usable.

The architectural embodiment of the plan is formal, serious, dignified. The Ionic columns are a concession to the neo-classicism of the day. Both the initial installation and the completed group will have the impressiveness that belongs to large physical dimensions, the human interest that attaches to very evident adaptation of construction to functional needs. Picturesque the museum will not be. Artistically it is open, of course, to objections applying to all perfectly symmetrical architecture, particularly when it is projected upon steel framework, with its rigidly mechanical spacings. The ideal housing for the collections of an art museum would perhaps be a series of comparatively small buildings, each of distinctive character, constructed of hand-dressed stone or hand-hewn timber. The background thus created would add charm to exhibits which suffer in the conditions of the ordinary art museum, however logically designed. But next best is the frankly neutral and unobtrusive kind which makes the best use possible of steel and concrete, contenting itself with being simple and unpretentious as regards details that cannot be positively beautiful.

A museum designed to secure the comfort of all classes of visitors will normally become an important civic centre. The man in the rusty black cutaway has become an object of especial solicitude. Wife and children he religiously takes to the art museum at least once a year on a Sunday afternoon. How to induce him to come more frequently, how to interest and not to weary him, is a problem full of technical difficulties. For him the allurements of landscape gardening in the forecourt, and other approaches of the museum. There are shady nooks for the polyglot population, and seats along the drives and pathways. Within the building broad avenues of circulation and other arrangements make the sightseeing easy. In the distribution of collections the habits of the perambulating crowd have been studied—its way of turning always to right rather than to left; its avoidance of small objects and dark corners. In German museums observation has shown that if entrance to a gallery and egress from it are by doors facing each other at opposite ends of one wall, the visitors walk along that side only, neglecting the other walls of the room. Many other apparently trivial facts of mob psychology are worth taking into account when a great place of popular resort is planned.

The procession of people through an art museum on a free day is at best a solemn function. Only the Italians have the audacity to be exuberant. Only the gamin grows voluble from the discovery, through inspection of a group of ivory cubes, that the ancient Egyptians, too, played craps. For the most part, pleasures connected with the static arts are taken soberly, if not sadly. What best can be done—as has been done in Boston—is to trace the causes of "museum fatigue" and, as far as possible, to eliminate them. Even infelicitous proportions in the lines of a gallery may give sense of weariness. The color of backgrounds has its effect in tiring or stimulating the perceptions. Objects must not be crowded together, as in an antique shop or in the Jarves collection at New Haven, but must be separated one from another by reasonable allowance of space. The lighting, whether from overhead or from the side, must be just right; elaborate experimental studies conducted in the interest of the Boston Museum have determined principles by which what is right may be readily ascertained. All that is publicly shown in such a museum is of the best; and, if the man from the street becomes interested in the exhibitions of a particular department, quiet, well-lighted study rooms and the assistance of a trained curator await him on the floor directly beneath.

Once art collections were a property of the royal palace. Now they belong to King Demos. The form taken by the Boston Museum is not, however, extreme in its recognition of the duty to be popular. It stops short of the radicalism of some of the more advanced "musæologists" of Europe and this country. It has not undertaken inordinately to broaden its field. Prudent and practical counsels prevailed in Boston. A civic centre of the graphic arts is all that is attempted.

A focus of professional as well as popular interest in the arts will have been provided when the first installation of the Museum of Fine Arts is opened two years hence. The covered courts of the museum will give opportunity for special exhibitions of a character such as no other American cities, except Washington and Pittsburgh, now have. Local associations, like the Copley Society and the Society of Arts and Crafts, may henceforth give their art shows under more favorable circumstances than ever before. The adjacent art school will centralize the student life of the city at the museum, and the tendency of Harvard to move "in town" will increase the educational usefulness of the collections. A new type of art museum has been evolved; as a part of the new university of the Fenway it will be tested under exceptionally favorable auspices.

A MARTIAN GOSPEL.

The long philosophical poem by Mr. Edward Henry Clement, read before the alumni of Tufts College, and entitled "The Gospel from Mars," is an encouraging sign. It shows that the muse still haunts our academic groves. Yet recent search through the periodicals published at American universities has revealed a dearth of poetry. Not even love, apparently, longer inspires undergraduates to write verses, and of the *indignatio* that makes them, they seemingly have little. But in Mr. Clement we discern the making of a New World Lucretius, or at least an incipient André Chenier; and he is plainly a man of university training. As befits a work which deals with cosmic problems, his is in blank verse. It was, says the author in the opening lines, at Tufts College that he learned of other worlds than ours, when he "first caught the goodly sphere of earth"—a figure which appears to be borrowed from the ball-field. The poet shows his appreciation by returning to his alma mater, and giving her the results achieved by contemplating the planet Mars; so

> Let Science then lend ear while Poetry
> Interprets wireless tidings flashed from Mars.

He reminds us that one Italian, Columbus, discovered America; that another Italian, Galileo, devised a telescope, "though his tube was but a reed compared with Lowell's yard-wide, light-beam net"; and that still a third, Schiaparelli, "called the lines he caught" on Mars, "canali." Our poet then proceeds to explain the origin and development of the Cosmos. How do we know, he inquires, "that the sun holds us enmeshed with all our sister worlds"? To those of us who did not know the fact, it is interesting to learn that it is because Nature is subject to law; that man with his godlike reason walks over the earth's crust, from which issue occasionally bursts of volcanic fire. These recall to us the planet's fiery origin, for the earth came from seething vapor, then was changed into water, became a "formless ooze," out of which emerged "drifting disks," minnows, and sea monsters. In time,

> To fins succeeded feet, out on dry land
> Life crawled at last—and struggled up to Man.

That gives a clear account of the "whence"; and a view of the "whither"

is also vouchsafed us. Mars being much older than the earth, is much drier. Life on its surface is more difficult. People there have had to "get together," as it were, and dig Schiaparelli's canals. That which has befallen Mars and its inhabitants must one day befall this terrestrial globe and ourselves. What the Martians have already done, we should do. Such is the poet's inspiring thesis. He admits that "the era of canals begins on earth," as he mentions Suêz and Panama, though strangely silent concerning the Welland and the Delaware and Raritan canals. The past of one planet tells the future of the other. Our own earth is fast becoming a desert, so we should attend to the matter while there is time, and, like the Martians, dig more energetically. No smiling optimist should divert us from this important task. Earth may be still so young that we can recall the Bagdad of Haroun-al-Raschid, and the vale.

> Where nightingales could hop from tree to tree
> Or cats walk roofs from Kashgar to the sea.

But earth will soon be a desert. Fortunately, before it is too late, the newest vehicles of travel are at hand, and we may accompany the poet on a tour through Mars, and come to close quarters with its gospel. He summons us thus:

> Come scale with me o'er Mars's yellow sands
> Mount in our aeroplane or gyroscope.

In this way we have a view of the ruined civilization in that distant region; and a vivid idea is gained of what will happen when the earth dries up. Of the smiling doubter, the poet sternly inquires: "Think you that the water syndicate would corner long the world's life-giving store?" The syndicate might seize the canals; but if these are to become dry, why should men take the trouble to dig them? It will go hard with vested interests in that coming day—as also with "the facile press" and "hireling jurists." They will be "the first muck to be swept away"; indeed, the last water left on earth shall do the sweeping. But moral improvement will come with the disappearance of water. It has already begun. Society will be reorganized when "love checks lust," "competition strives in service, and all that any have shall be for all."

The gospel from Mars is opposed to Darwinism. Survival of the fittest, according to the poet, means survival of the highest in mind and soul.

> We have outgrown the reddened tooth and claw,
> The strenuous life of anthropoidal apes,
> That grin and chatter platitudes outworn,
> And pelt Peace Congresses with cocoanuts.

But is not that a dangerous mixture of *lèse-majesté* and nature faking?

The Tufts alumni were made to understand that the hope for those on this drying earth lies not in religion, for we "have outgrown the dogma and the creed"; nor in a pulpit that "preaches rebates," nor in the universities which foster privilege, but in the "gospel sent by the living Mars." Mr. Clement's poem would have to be laid aside until cool weather, as its effect on the reader is that of a blast from Sahara, were it not for its concluding lines, wherein the author "steps out" of his library upon the wet grass, looks up at the sky and sees Mars set. That passage makes pleasant summer reading. But we fear that into the poet's brain, while his attention was fixed on the distant canals, may have stolen unwittingly the beams of the moon, with their well-known unhappy effect.

CHESTERFIELD.—I.

A "Life of Lord Chesterfield"* devoted almost exclusively to the political career of that arbiter of elegancies might seem to promise an oddly distorted portrait. Yet from any point of view we may welcome Mr. Craig's careful, if ill-composed, work. It will at least do something to modify the contemptuous ignorance which passes commonly for a judgment of his lordship, and which, for one reason or another, has overtaken most of the men who fought in the Opposition to that right British master, Sir Robert Walpole. And a sober consideration of his career brings also a new element into our opinion of his Letters. We are likely to look with more lenience on his reiterated preaching of politeness and superficial address when we remember that in active life he himself played an honorable and manly part. The second member of his favorite motto, *Suaviter in modo, fortiter in re*, assumes a just proportion to the first by a comparison of his acts with his words.

Philip Dormer Stanhope, the fourth Earl of Chesterfield, came of a distinguished house, so ancient that he could safely ridicule the vanity of birth by setting up portraits of Adam and Eve de Stanhope in his family gallery, and by calling it, in one of his *World* papers, "the child of Pride and Folly, coupled together by that industrious pander Self-love." He was born in St. James's Square, London, in 1694. His father, the third Earl, seems to have been more distinguished by stubbornness than any other quality; being a strong Jacobite, he punished his heir's Hanoverian tendencies by cutting his allowance down to five hundred pounds a year, and, for his other traits, we may suppose that Swift exaggerated a little when he wrote: "If it be old Chesterfield, I have heard he was the greatest knave in England." The son lived not at home, but with his maternal grandmother, the excellent Marchioness of Halifax, who indulged his bent and kept him out of school until, at the age of eighteen, he was entered at Trinity Hall, Cambridge. Here apparently he combined the studious and the rakish life, with a predominance of the former. At any rate, he steeped himself in the Classics, and began that discipline in the precise use of language, which made him one of the first masters of English. His method of study he explained later to his son: "So long ago as when I was at Cambridge, whenever I read pieces of eloquence (and indeed they were my principal study), whether ancient or modern, I used to write down the shining passages, and then translate them as well and as elegantly as ever I could; if Latin or French, into English; if English, into French." At nineteen he left the university, if we may believe his own words, as precious a pedant as ever went up to London: when he talked best, he talked Horace; his wit was to quote Martial, and his notion of a fine gentleman to follow Ovid. He never forgave the university for sending him out with this tincture of scholasticism, and his unrelenting rancor inclines one to believe that his accounts of a blundering start in society are not a commonplace fiction for pointing a moral. And indeed, as his perfected manners were the polish of a sensitive egotism, it is natural that his entrance upon the world should have been marked by an awkward self-consciousness. He would not permit his son to go either to Cambridge or Oxford. His letters speak of the universities always with hatred and contempt, and one of his journalistic portraits of a boor repeats the theme: "As he had resided long in college, he had contracted all the habits, prejudices, the laziness, the soaking, the pride, and the pedantry of a cloister, which after a certain time are never to be rubbed off."

It need not be said that Chesterfield soon rubbed off his *mauvaise honte* by contact with the world. For some years he served in the lower house of Parliament with indifferent success. At the age of thirty-one he succeeded to the earldom by the death of his father, and began his real career, being better fitted by temperament and education for influence among the Lords than among the Commons. Two periods in his political activity stand out prominently: his mission as ambassador to The Hague from 1728 to 1732, and his viceroyalty of Ireland in 1745-6; in both which offices he showed undoubted ability. At The Hague, where the tangled dynastic relations of Europe were debated, he kept his head and maintained the honor of England—and no man could do more. To Ireland he gave for eight memorable months a happy government, showing a peculiar sympathy for that tormented people. Some of his best-known witticisms come from Dublin, and his wit, together with his firm tolerance, was an important element in his success. "I would much rather," he once said, "be distinguished and remembered by the name of the *Irish Lord-Lieutenant* than by that of the Lord-Lieutenant of Ireland." Again, at a critical moment, when a Castle official brought him word in the morning that "the people of Connaught were actually rising," he first gravely consulted his watch and then replied with composure: "Well, it is nine o'clock, and certainly time for them to rise; I therefore believe your news to be true." In the interval between his residence at The Hague and in Dublin he was, until Walpole's downfall in 1742, a member of the cabal, which led the Opposition and gave hostility to that minister the name of Patriotism. Chesterfield's part in the political game was an active, but not a leading, one. He had neither the virulent pen nor the personal weight of Bolingbroke; he could not intrigue with the trim-

* *Life of Lord Chesterfield.* An account of the Ancestry, Personal Character, and Public Services of the Fourth Earl of Chesterfield. By W. H. Craig. New York: John Lane Co. 1907.

ming Pulteney, or contend against the domineering, gusty Carteret; but he wrote and spoke much, and took his part in the harrying of the great Parliamentary boar. After his return from Ireland, he was for a while secretary of state in the Broad-bottom ministry of the Pelhams, but gradually dropped out of the arena into the quiet of a valetudinary old age that fluttered between the magnificent library of Chesterfield House in South Audley Street and his gardens and *Babiole* at Blackheath. "I am now, for the first time in my life," he writes to an old friend in 1753, "impatient for the summer, that I may go and hide myself at Blackheath and converse with my vegetables *d'égal à égal* which is all that a deaf man can pretend to. . . . The place agrees with my health and becomes my present situation. It employs my eyes, my own legs, and my horse's agreeably without having any demand upon my ears, so that I almost forget sometimes I have lost them." As for the library in his city house, it was one of the spectacles of London, and still exists, little changed. In 1845, a writer in the *Quarterly Review* thus described,

> What he boasted of as "the finest room in London"—and perhaps even now it remains unsurpassed—his spacious and beautiful library, looking on the finest private garden in London. The walls are covered half-way up with rich and classical stores of literature; above the cases are, in close series, the portraits of eminent authors, French and English, with most of whom he had conversed: Over these and immediately under the massive cornice, extend all round in foot-long capitals the Horatian lines:
>
> Nunc veterum libris. Nunc somno et inertibus horis.
> Ducere solicitæ jucunda oblivia vitæ.
>
> On the mantelpiece and cabinets stand busts of old orators, interspersed with voluptuous vases and bronzes, antique or Italian, and airy statuettes in marble or alabaster of nude or semi-nude opera nymphs.

Stoic we may believe the oblivion of the half-cloistered wit, deaf and broken in health, to have been, but jocund never. "Physical ills," he writes, "are the taxes laid upon this wretched life; some are taxed higher, and some lower, but all pay something. My philosophy teaches me to reflect how much higher, rather than how much lower, I might have been taxed." And again: "I read a good deal, and vary occasionally my dead company. I converse with grave folios in the morning, while my head is clearest and my attention strongest; I take up less severe quartos after dinner; and at night I choose the mixed company and amusing chit-chat of octavos and duodecimos. *Je tire parti de tout ce que je puis;* that is my philosophy; and I mitigate, as much as I can, my physical ills by diverting my attention to other objects." It is the *savoir vieillir*, the bland resignation of the man of the world, such as we meet in page after page of the letters of Horace Walpole, like Chesterfield, old and gouty: "Visions are the consolation of life; it is wise to indulge them, unless one builds on them as realities. Our dreams are almost at an end! Mine are mixed with pain; yet I think it does not make me peevish. I accept with thankfulness every hour in which I do not suffer. I am not impatient for the moment that will terminate both anguish and cheerfulness, and I endeavor to form my mind to resigning the first with gratitude, and the latter with submission." The visions of Chesterfield, we may fancy, were more solid than those of the epicure of Strawberry Hill. He had seen the great world, and knew men and manners. From those perpetual friends, his books, he could turn to memory of Mr. Addison and Mr. Pope, in whose company, as he wrote, he used to feel in society as much above himself as if he had been with all the princes in Europe. The quarrels and reconciliations of those mighty wits, no doubt, he reflected upon much, as also upon the coarser battles of the politicians, including the relentless Lord Bollingbroke. Much, too, he must have thought of the flutter of more effeminate society, and of his own reputation as the glass of form, given so grudgingly by his rivals, won with such pains to himself. There was a world of recollections to occupy the gouty and somewhat lonely old gentleman in his chair.

We can almost see him in his library by his garden window, a frail and uncomely figure, the eyes, beneath the bushy high-arched brows, large and touched with pain; the mouth small and lifted in a half-kindly, half-cynical smile; the chin heavy, but rounded to a point. So Gainsborough painted him, and so the face appears, not without nobility and power, in most of the memoirs of the day. But the voice was shrill and the body curiously awkward. Plain-speaking George II. calls him a "dwarf baboon," and handsome Hervey, Pope's "white curd of ass's milk," who has no love for his person or respect for his morals, will not even allow any dignity to the countenance:

> With a person as disagreeable as it was possible for a human figure to be without being deformed, he affected following many women of the first beauty and the most in fashion; and, if you would have taken his word for it, not without success; whilst in fact and in truth he never gained any one above the venal rank of those whom an Adonis or a Vulcan might be equally well with, for an equal sum of money. He was very short, disproportioned, thick, and clumsily made; had a broad [it is narrow in the portraits], rough-featured, ugly face, with black teeth [he alludes himself to this defect], and a head big enough for a Polyphemus. One Ben Ashurst, who said few good things, though admired for many, told Lord Chesterfield once that he was like a stunted giant—which was a humorous idea and really apposite. Such a thing would disconcert Lord Chesterfield as much as it would have done anybody who had neither his wit nor his assurance on other occasions; for though he could attack vigorously, he could defend but weakly, his quickness never showing itself in reply, any more than his understanding in argument.

Lord Hervey's report of this encounter with Ben Ashurst might be used as a simile of the Parliamentary contest between Chesterfield and Sir Robert. And in other respects the description is something more than gossip; it helps to explain the exaggerated insistence upon form and manner in a man who could leave nothing to nature, but must win his reputation entirely by art. We must remember always that the great Earl, in writing to an ungainly son, had had also his own ungainliness to overcome. And we must remember, too, that his passionate interest in the son's ambition arose in part from a feeling that his own career had fallen short of what his powers promised. He had held office and had won respect as a speaker in Parliament, yet his actual weight in the Government, or against it, was never equal to his capabilities; and of this he seems to have been painfully conscious. We may give various reasons for this partial failure of his ambition, but the truth probably lies in Hervey's caustic words:

> Lord Chesterfield was allowed by everybody to have more conversible entertaining table-wit than any man of his time; his propensity to ridicule, in which he indulged himself with infinite humor and no distinction, and with inexhaustible spirits and no discretion, made him sought and feared, liked and not loved, by most of his acquaintance; no sex, no relation, no rank, no power, no profession, no friendship, no obligation was a shield from those pointed, glittering weapons, that seemed to shine only to a stander-by, but cut deep in those they touched. . . . I remember two lines in a satire of Boileau's that fit him exactly:
>
> Mais c'est un petit fou qui se croit tout permis,
> Et qui pour un bon mot va perdre vingt amis.
>
> And as his lordship, for want of principle, often sacrificed his character to his interest, so by these means he as often, for want of prudence, sacrificed his interest to his vanity.

The truth is his lordship was not much liked or trusted. From the King down he made men feel the inferiority of their minds, and this, in an age when politics were so completely personal, was in itself enough to ruin him. And, besides, he did not play the game. Bribery and corruption were the tools of administration used notoriously by Walpole, as they were in turn by the protesting Patriots; now Chesterfield would not take a bribe, and is one of the few men who came out of public life with clean hands. So much was to his honor and not against his influence, but he had an uncomfortable way of failing to see that other men might pocket their rewards and still be honest within the acknowledged rules of the sport. He lacked apparently the first requisite of political *savoir vivre*, and in this he was coupled with Lord Carteret: "They both of them, too, treated all principles of honesty and integrity with such open contempt that they seemed to think the appearance of those qualities would be of as little use to them as the reality, which must certainly be impolitic, since always to ridicule those who are swayed by such principles was telling all their acquaintance, 'If you do not behave to me like knaves, I shall either distrust you as hypocrites or laugh at you as fools.'" After following Chesterfield's career in all its details and allowing credit to his incorruptibility and his occasional efficiency, one still returns, unfairly it may be, to the judgment of Horace Walpole on reading his Letters: "Yet in all that great character what was there worth remembering but his *bons mots?* . . . from politics he rather escaped well, than succeeded by them"—so dangerous is the reputation for wit.

As a maker of *bons mots*, rather than as a statesman, he moves through the records of the age, and it should seem that people looked for his inevitable witticism at every occurrence in the government or society. So Mrs. Montagu sends to her husband "an admirable *bon mot* of Lord Chesterfield's" on the perplexities of George III. just come to the throne: "He said the King was in doubt whether he should burn Scotch coal [Bute], Pitt coal, or Newcastle coal." And

Horace Walpole, as part of the regular news of the day, writes to Horace Mann, "two new *bons mots* of his lordship much repeated, better than his ordinary." At another time, after relating an outrageously wicked retort to Mrs. Ann Pitt, Chatham's sister, he breaks out: "What gayety and spirit at seventy-five, and how prettily expressed! It contains the cheerfulness of the wars of the Fronde in France."

On one occasion Chesterfield left the retirement of his library and gardens, and what he then accomplished was the proudest achievement of his life. In 1582 Gregory XIII. had reformed the calendar, and all the countries of Europe, except England, Russia, and Sweden, had adopted the New Style. As a consequence, there were in Chesterfield's day two different methods of reckoning dates, an inconvenience which had been impressed upon him by the difficulties of his correspondence during his embassy to The Hague. In 1751 he had a bill introduced in Parliament by which the year henceforth should begin the 1st January, instead of the 25th March, and the eleven superfluous days should be voided by calling the 3d September, 1752, the 14th. Superstition, habit, and the embarrassment of altering contract dates combined to oppose the bill, but with the aid of Henry Pelham, who was prime minister, and of the Lord Chancellor Macclesfield, it was passed in the end. He was fond of repeating the story of the triumph to his son in that vein of didactic modesty so peculiarly his own. March 18, O. S., 1751, he wrote:

> I was to bring in this bill, which was necessarily composed of law jargon and astronomical calculations, to both of which I am an utter stranger. However, it was absolutely necessary to make the House of Lords think that I knew something of the matter, and also to make them believe that they knew something of it themselves, which they do not. For my own part, I could just as soon have talked Celtic or Sclavonian to them as astronomy, and they would have understood me full as well; so I resolved to do better than speak to the purpose, and to please instead of informing them. I gave them, therefore, only an historical account of calendars, from the Egyptian down to the Gregorian, amusing them now and then with little episodes; but I was particularly attentive to the choice of my words, to the harmony and roundness of my periods, to my elocution, to my action. This succeeded, and ever will succeed: they thought I informed, because I pleased them; and many of them said that I had made the whole very clear to them, when, God knows, I had not even attempted it. Lord Macclesfield, who had the greatest share in forming the bill, and who is one of the greatest mathematicians and astronomers in Europe, spoke afterwards with infinite knowledge and all the clearness that so intricate a matter would admit of; but as his words, his periods, and his utterance, were not near so good as mine, the preference was most unanimously, though most unjustly, given to me.

After this incursion into public life, he returned to valetudinarian ways, preparing himself with tranquil stoicism for the end, ever ready with a jest or a sententious fling at destiny. He reminds one of Franklin, without Franklin's great body and without his imperturbability. "Not so loud," he replied to one who accosted him in the street walking with a friend. "The fact is that Tyrawley and I have been dead these two years, only we don't wish it to be generally known." It is like Franklin's "I seem to have intruded myself into the company of posterity, when I ought to have been abed and asleep." Eight years before his death he was in a mood to write to his son: "I feel the beginning of the autumn, which is already very cold; the leaves are withered, fall apace, and seem to intimate that I must follow them; which I shall do without reluctance, being extremely weary of this silly world." Everybody knows his last words—they are classic—spoken when the *valet de chambre* opened the curtains of his bed and announced his old and well-tried friend: "Give Dayrolles a chair." That act of formal courtesy should be added to the illustrations of Pope's ruling passion strong in death.

He died March 24, 1773, leaving the tradition of his wit to be taken up by such lesser men as George Selwyn, Richard Brinsley Sheridan, and Sidney Smith. The letters to his son, which have made him at once famous and infamous to posterity, had been published surreptitiously before his death. They demand treatment at length.

P. E. M.

NEWS FOR BIBLIOPHILES.

The two copies with undated title-page of George Herbert's "The Temple, Sacred Poems and Private Ejaculations," one in the Huth library in England, the other in the no less famous library of Robert Hoe in New York, have long been the envy of other collectors. Lowndes gives the date of this undated form as 1631, and says: "A few copies of this, the first and rarest edition, were issued for presentation to the author's friends without date." This date and Lowndes's statement have been frequently copied. The so-called first published edition has a slightly different title, with date 1633. There is also another edition of the same date, having the words "Second Edition" on the title, the types of this being an entirely new resetting. Lowndes's statement that the undated copies were "issued for presentation to the author's friends" was probably merely an opinion based upon the fact that the Brand-Heber-Daniel copy (the only one he had seen), now Mr. Hoe's, was ruled around in red ink and was in a contemporary tooled binding, as is also the Huth copy. This is a reasonable surmise, and it is not at all impossible that Nicholas Ferrar, the editor, did have a few copies ruled up for presentation. But the date 1631 is entirely wrong, and the undated title is almost certainly a later printing. "The Temple" was not printed until after the author's death, which took place the end of February, probably (he was buried March 3), 1633.

We have been permitted to examine the very fine copy in the original sheep-binding of the first edition (with dated title), which sold at Sotheby's for £104 on May 18, 1903, and there can be no doubt that the title-leaf of this copy was the one printed with the first signature, and was not an inserted or substituted leaf. If the titles of the three books (without date, first edition dated 1633, and second edition dated 1633) are placed side by side, it will readily be seen that the more logical position of the undated title-page is between the two first dated editions. The first edition (dated 1633) has, "By Mr. George Herbert." The undated edition and the second edition read alike, "By Mr. George Herbert, late Oratour of the Universitie of Cambridge." The imprint of the first edition is: "Cambridge: Printed by Thom. Buck, and Roger Daniel, printers to the Universitie. 1633." That of the undated edition reads: "Cambridge: Printed by Thomas Buck and Roger Daniel: And are to be sold by Francis Green, stationer in Cambridge." The imprint of the second edition is: Printed by T. Buck, and R. Daniel, printers to the Universitie of Cambridge, 1633. And are to be sold by Fr. Green." To these may be added the imprint of the third edition, which, as given by Hazlitt, is "Printed by T. Buck, and R. Daniel, . . . 1634. And are to be sold by Fr. Green."

The fact that the imprint of the first edition contains no bookseller's name, while the two other forms of 1633 and the next edition of 1634 contain the name of a "stationer," would be strong evidence that this was the "privately printed" form, if it were positively known that such an issue did appear. In the same way "By Mr. George Herbert" was sufficient for friends of the author, while to tell strangers that he was "late Oratour of the Universitie of Cambridge" would be likely to help the sale of the book.

UNPRACTICAL TEACHING.

To the Editor of The Nation:

Sir: In a recent editorial you mention a list of subjects given out in some of the New York schools to young children for investigation, showing your amazement that such broad and difficult topics should be assigned to minds so immature. As a teacher, I was highly gratified to see a journal of your standing take up this pedagogical matter. I fear that our education has suffered because the capable thinking people outside of the schoolroom take so little interest in what is going on within. As a member of the educational system of one of our most important cities, I have seen just such instances of poor judgment in directing the work of pupils, being guilty myself of such mistakes. I am not going to try to shift any blame from my own shoulders when I offer an explanation for this overshooting of the mental ability of young children. But I am convinced that a great deal of it is due to the method of supervision. In every large educational organization in this country that I am at all acquainted with there are numbers of the higher rank who never do any teaching, but who are expected and required generally to inspect it very closely and critically. Of necessity, these persons very soon get up in the clouds, and view the work from this lofty height. They are enthusiastic and ambitious, and many of them very soon lose all connection with practical instruction. Hence, they have no test for their theories, but having the authority they can insist upon their subordinates attempting to put these beautiful notions into actual use.

I fear that you can look for still wilder experiments, as there is a tendency to have more and more employees who do not teach. I see no corrective except a rigid insistence that all should be held responsible for actual steady work with a class, except some half-dozen—not more even in so large an organization as in New York city. I do not mean that they should give full time;

far from it, as that would destroy their power for initiative and leadership; but I cannot see why they could not give at least three hours a week. This would cover one entire subject in the average high school for one year, or two such in the grammar grades. There is no other substitute for keeping an educational captain's feet on hard mother earth. B. C.

Washington, June 24.

PRESENT CRISIS IN FRANCE.

To the Editor of The Nation:

Sir: Just two years ago I wrote these words: "Falsification of wine is carried on to such an extent that it is almost impossible for grape-growers to make a living." The revolt of four departments of the South is the outcome of these vast frauds, and of the shameless propaganda of alcoholism in France by means of *buvettes* found at every step, so to speak.

It is pretended that this crisis is the result of overproduction. This is not so. More French wine is sold and exported than is produced. It is said that the Genevan authorities threw many hogsheads of manufactured claret into the Rhone last year, and Mr. Lassies affirmed in the Chambers that recently many thousand hectolitres of falsified or manufactured wine were sold to the *assistance publique* at Paris!

Formerly, till within the last twenty-five years, the French drank nothing but their own natural wines, and they were the most temperate people in Europe. To-day more alcohol is consumed in France than anywhere else.

Cities.	Population.	Liquor-sellers.
New York	3,437,000	10,821
Chicago	1,698,000	5,740
London	4,536,000	5,860
Paris	2,661,000	30,000
St. Petersburg	1,500,000	513
Glasgow	760,000	1,430
Washington	279,000	492

What has thus transformed the French nation into an alcoholic people? An enemy hath done it. Those whom M. Brunetière called "les ennemis de l'âme Française" have killed the grape, and debauched the people with alcoholic drinks of the worst kind. The kind of absinthe sold at popular *buvettes* is recognized to be of a most deadly sort. The sale of superior kinds of absinthe has slightly diminished as the richer classes begin to understand the evils it engenders. Some one has said, "divide and reign"; corrupt and reign is the motto of the Judeo-masonic coterie that rules in France. With commerce and shopping paralyzed by a general strike of *inscrits maritimes*, mass meetings of 100,000 to 300,000 winegrowers in revolt, carrying around small guillotines with the inscription "mort aux fraudeurs"—the Government publicly accused of having falsified and suppressed the Montagnini papers sent to the Parliamentary commission itself—to say nothing of a mass meeting of 5,000 Catholics at the Cirque d'Hiver, Paris, a few days ago, one might suppose the French rente would have fallen a little. On the contrary, it climbed up to 95.30 yesterday. Everything is artificial in France. When the collapse comes people will be surprised; and come it must, in spite of the Internationale. Anarchy and incoherence cannot always do duty for Government.

J. Napier Brodhead.

Nice, France, June 4.

GOETHE AND THE THEATRICAL SYNDICATE.

To the Editor of The Nation:

Sir: Goethe's suggestion that the United States take in hand a Panama Canal (Eckermann, English ed., p. 222), and Mephisto's method of providing paper currency, are instances of anticipation that have more than once been referred to. It is probably less known, however, that the modern theatrical syndicate can find an argument in its favor in Goethe's Conversations. "If I had the management of a theatre now," he writes, "the entire winter should be provided with superior 'stars.' . . . Keep on with your starring, and you will be astounded at the advantage which will result both for the theatre and the public. I foresee a time when a clever man, who knows his business, will take charge of four theatres at once and provide them with stars by turns. And I am confident that he will maintain his hold better than if he had only one."

Abram S. Isaacs.

New York University, June 22.

THE RHYTHM OF "CHRISTABEL."

To the Editor of The Nation:

Sir: It is more or less customary to refer to Coleridge's fragment "Christabel" as an example of musical verse.

(1.) Is it, or is it not, true that the requirements of rhythm, as applied to metrical composition, are continually violated in this poem?

(2.) Is the general versification therein followed admitted to belong to any form recognized as regular, as established by the masters and by the authorities on this subject? Inquirer.

New York, June 24.

[If the word "regular" is used as applied by the school of Pope, the rhythm of "Christabel" is not regular. It follows, for the most part, the older English four-beat metre, divided into four measures of equal time, but with a varying number of syllables in each measure. Read in this way, the lines are highly musical. Coleridge thought his rhythm was an invention of his own, but his originality consisted really in introducing a form, with variations and expansions, which had merely been forgotten.—Ed. Nation.]

Notes.

Macmillans are issuing a new edition of Louis Einstein's "Italian Renaissance," which has been out of print for some time.

Dr. J. S. Milne has written for the Oxford University Press a long monograph on "Surgical Instruments in Greek and Roman Times." The subject has never before been fully investigated.

A new edition of F. Loraine Petre's "Napoleon's Campaign in Poland" is issued by John Lane Co. A number of illustrations have been added, and constitute the only new feature.

William J. Long's story of "Wayeeses the White Wolf," the *casus belli* with Washington, is reprinted by Ginn & Co. in a separate volume, with all the illustrations as they appeared in "Northern Trails."

"The Memoirs of Madame Ristori," translated by G. Mantellini, will be issued by Doubleday, Page & Co. in August.

Prof. Kuno Francke has brought together a number of his recent magazine papers under the title "German Ideals of To-day" (Houghton, Mifflin & Co.). As seven of them appeared originally in the *Nation*, it scarcely becomes us to be voluble in praise. The spirit of the book may be summed up, in the words of the Preface, as an attempt to set forth "the concentrated striving of contemporary Germany for the vision of eternal things."

Dr. Berbig, pastor in Neustadt (Koburg), has discovered in the ducal archives the letters of advice sent by the Kurfürst Johann, with various articles to Martin Luther, in 1530. They help to date Luther's letters of that period. They are to be published soon.

A movement has been started at Portsmouth, N. H., to purchase the old home of Thomas Bailey Aldrich on Court Street for a museum. This is the house described in "The Story of a Bad Boy."

Mrs. W. E. H. Lecky would feel very much obliged if those who possess any letters from the late Mr. Lecky, which might be of use as a memoir, would forward them to her, at No. 38 Onslow Gardens, London, S. W. They will be returned in due course.

A committee has been formed to raise subscriptions for a memorial to the late Mrs. Craigie (John Oliver Hobbes). The purpose is (a) to set up a portrait plaque, in marble or bronze, in University College, London, where she studied; (b) to set up a replica of this in a suitable position in the United States; (c) to establish an annual scholarship in England for the study of modern English literature, and (d) to give a similar scholarship in the United States. The secretary of the committee is Miss Zoë Procter, No. 62 Chester Terrace, Eaton Square, S. W., London.

The committee organized some time ago for purchasing Coleridge's cottage at Nether Stowey reports that sufficient money has been contributed for this purpose, but that £200 is still needed for maintenance.

The Second International Congress for Physical Therapeutics has been called to meet in Rome from the 13th to the 16th of October.

The fourteenth International Congress for Hygiene and Demography meets in Berlin, in the Reichstag building, from the 23d to the 29th of September. Its work will be done in eight sections, and more than one hundred hospitals and similar institutions are to be inspected by the members.

The *Kladderadatsch* of Berlin recently entered upon its sixtieth year, and on this occasion published a jubilee number, in which the customary poem was not lacking. This most notable of German comi-

cal papers is originally the product of the revolutionary year of 1848, and was founded by David Kalisch in conjunction with the publisher Hofmann. Its present editor is Johannes Trojan.

The first issue of the *Oxford and Cambridge Review*, comes out with a cover red enough to hurt the eyes. The contents are milder. Well-known men of the universities have contributed a series of thoughtful articles showing the general trend of educational ideas. Among the papers is a hitherto unprinted essay of John Stuart Mill's "On Social Freedom."

The *Hibbert Journal*, a quarterly review of religion and philosophy, has been edited by Prof. L. P. Jacks, dean of Manchester College, Oxford, with the assistance of a distinguished board of British scholars. The aim of the magazine has been to establish a bridge of communication between the educated layman on the one hand and the expert scholar on the other. An American advisory board has now been added, consisting of B. W. Bacon, professor of New Testament criticism and exegesis, Yale; William Adams Brown, Rooseveit professor of systematic theology, Union Theological Seminary; Dr. E. B. Craighead, president of the Tulane University of Louisiana; Dr. Samuel A. Eliot, president of the American Unitarian Association; G. H. Howison, professor of philosophy, University of California; C. J. Keyser, Adrain professor of mathematics, Columbia University; A. O. Lovejoy, professor of philosophy, Washington University, St. Louis; A. C. McGiffert, professor of church history, Union Theological Seminary; R. Heber Newton, D.D.; Josiah Royce, professor of the history of philosophy, Harvard; George E. Vincent, professor of sociology, University of Chicago; Dr. R. S. Woodward, president of the Carnegie Institution.

One could not have forseen that so much delightful—in fact, indispensable—information could be added to one's Baedeker as is contained in "Sojourning, Shopping, and Studying in Paris," by Elizabeth Otis Williams (McClurg & Co.). Tourists will do well not to omit it from their handbags.

A noteworthy tribute was paid to the missionaries in the East by the Hon. Alfred Lyttelton, colonial secretary in the Balfour Cabinet, at the recent anniversary meeting of the Society for the Promotion of Christian Knowledge. He said that "during the whole time that he was at the Colonial Office no missionary ever gave the ministers of the crown the slightest trouble or uneasiness. . . . No questions were full of more profound difficulty than those which affected the native races, and the advice which from time to time he received from missionaries in the colonies who were dealing with native races was such as proved of the greatest possible value to him."

An almost universal interest in education is to-day the most suggestive mark of activity in Syria and the adjacent countries. This is very largely due to the American College at Beirut, whose graduates, medical, collegiate, commercial, etc., says Consul-General Ravndal, "have become a mighty instrument of civilization." In eight years the number of students has increased from about 275 to more than 850, including 200 Mohammedans, and representing all the Levant and the near East. The increase in the future is expected to be still larger, since the great cities to the east and northeast have become more accessible through improved railway facilities. In Beirut itself an imposing Government industrial school is being erected, and the Government Medical School at Damascus is preparing to put up permanent buildings. Education is transforming Syria through the raising of the standard of living and the development of the resources of the country.

The winners of a number of the prizes given by the Académie Française have been announced. Under the Prix Montyon 1,500 fr. goes to Marius Roustan for his "Philosophes et la société française au xviiie siècle"; also six awards of 1,000 fr. each go to Mme. Edgy for "La Servante," Mme. Alberich-Chabroi for "L'Offensive," Achille Millien for "Chantes et chansons," Georges Lechartier for "L'Irréductible Force," Edmond Ferry for "La France en Afrique," and Prince Louis d'Orléans for "À travers l'Hindo-Kush." The Prix Furtado, of 1,000 fr., goes to Henri Mazel for "Ce qu'il faut lire dans la vie."

The Academy of Inscriptions and Linguistics in Paris was recently petitioned to express its views in reference to an artificial world language, and especially to Esperanto. The Berlin *Vossische Zeitung* states that the Academy by unanimous vote decided not to express any conviction on the subject, on the ground that it could not waste its time on such discussions.

The principal article in *Petermann's Mitteilungen*, number five, is by Prof. E. Hammer on the latest methods of constructing accurate topographical maps. The accompanying chart illustrates his course of instruction in topographical drawing given to the pupils of the high schools at Stuttgart. The other main contents are some notes on a map of the region between Ibi and Yola on the Benue, the great eastern branch of the Niger, and the geographical courses for the summer term in the German Universities.

The second number of the *American Journal of International Law* maintains the high promise of the initial issue. It continues the Chronicle, for the ensuing three months; opens with Secretary Root's comprehensive and instructive address on the Real Questions Under the Japanese Treaty, apropos of the California School controversy; discusses the Convention of 1907 between our Government and the Dominican; comments on the Geneva convention of 1906; puts forth some suggestions as to a Permanent Court of Arbitration; considers a Permanent Tribunal of International Arbitration, Its Necessity and Value; presents a continuation, by Robert Lansing, of his Notes on State Sovereignty—a paper that goes back to the criticisms of Sir Henry Maine on Austin's theory; and gives Richard Olney's critical address, delivered at the recent meeting of the Society in Washington, on the Development of International Law. Among the discussions in recent literature bearing on the confessedly paradoxical Korean situation, this Journal's five pages on the International status of that country are easily among the most comprehensive and valuable. The necessary historical background is given, with a statement of the present status, now that Japan, which for years demanded an independent autonomy for the Hermit Kingdom, has established over it "a protectorate of the strictest kind"—a result to which the Treaty of Portsmouth contributed. The Japanese situation in California is also considered, in an editorial concluding with a quotation from the (London) *Law Magazine and Review*, that "no infringement of Japanese rights, contractual or real, can be said to have been committed." The new Immigration law is also critically discussed, as is Extraterritoriality and the United States Court for China. The editor, Dr. James Brown Scott, solicitor of the State Department, formerly a professor in the Columbia University Law School, should find himself in familiar fields when discussing such questions as these. A Chronicle of International Events, compiled by Henry G. Crocker, appears, and a table of public documents, by Philip DeWitt Phair. The selection, in each number, of judicial decisions relating to international law is comprehensive—not limited to American decisions, but taking in English cases, and notably one Scotch case of technical interest—that of Mortensen, who had been convicted of using the method of fishing known as "otter trawling" in Moray Firth within certain prohibited limits.

One other distinctive feature of the Journal should be noticed, that accompanying each number is a supplement of official documents. These supplements are uniformly but separately printed, and consecutively paged by themselves, so that they can be kept at hand for reference in a form to occupy the least space. They exhibit a multitude of agreements, conventions, treaties, and other valuable international documents; comprehending the Treaty of Portsmouth and antecedent British-Japanese alliances, legislation and agreements respecting our rights in the Newfoundland fisheries, a translation of the long Algeciras agreement, Franco-British and Franco-Spanish declarations respecting Morocco and Egypt, etc., while one (the second) goes back and takes in the 1856 Declaration of Paris, the Brussels Convention of 1874, the Geneva Convention of 1884, that of Geneva of 1906 for the amelioration of the condition of the sick and wounded in the field, with our 1907 treaty with the Dominican republic relating to the customs revenue; agreements concerning Korea, and about a score of others, of great importance. Each member of the Society of International Law receives the *Journal* and its Supplements, with no expense except the payment of his annual dues; and membership is not restricted to members of the bar. It seems appropriate to accord the new publication a very cordial welcome. Messrs. Baker, Voorhis & Co. are to be the publishers from this time on.

The second volume of the "Catalogue of Hebrew Manuscripts in the Bodleian Library," (Oxford: Clarendon Press), by Adolph Neubauer and Arthur Ernest Cowley, contains the additions to the collection since 1886, including the great mass of fragments from the Geniza of the old synagogue in Cairo. The work was begun by Dr. Neubauer, the editor of the former volume of the Catalogue, and, after the failure of his health, was completed by Mr. Cowley. The whole number of manuscripts

described in the volume is 316, of which 166 (containing 2,675 pieces) are from Cairo. The identification and detailed description of these mutilated and often half-obliterated fragments have been the chief task of the cataloguer, which has been fulfilled with unsparing pains. Full indexes do all that can be done to help the student find what he is seeking in this mass of material.

In "The Hebrew Literature of Wisdom in the Light of To-day" (Houghton, Mifflin & Co.) Prof. J. F. Genung has followed up his earlier studies on Job and Ecclesiastes by a more comprehensive popular survey of the Hebrew "Wisdom," including the sapiential books of the Old Testament, Sirach and the Wisdom of Solomon, and from the New Testament the discourses and parables of Jesus and the Epistle of James. His aim, as defined in the preface, is "to unfold in the literary idiom of to-day, what that strain of scripture utterance known to scholars as Wisdom means, for now and all time, as distinguished from, or rather as added to, what supposably it once meant"—to interpret the living spirit of these ancient writings rather than the dead letter. This task is accomplished with insight and sympathy; the reader is made to realize how large and enduring a part of our intellectual and moral inheritance we have in these books. The style sometimes offends a severe taste, and we had rather not believe that monstrosities like "factual" belong to the literary idiom of to-day—or to-morrow.

A judicious life of Frederick Douglass, from the appropriate and competent hand of Booker T. Washington, forms the latest addition to the American Crisis Biographies (George W. Jacobs & Co.). Douglass's career, from whatever standpoint it is viewed, was certainly remarkable. Born a slave, he rose, by virtue of his own ability and industry, aided by fortunate circumstances, to a position of commanding influence among the negro race in this country, and to a foremost rank among American orators. He began his public career as an enthusiastic disciple of Garrison, but found himself compelled, as time went on, to differ fundamentally from the great abolition leader; and, although he remained through life a radical reformer, he gained rather than lost influence as the struggle progressed, and exhibited a discretion and courteous good-temper which his associates sometimes lacked. His political prominence brought him reward, not only in a wide acquaintance at home and abroad, but also in the gift of such important offices as those of marshal, and later recorder of deeds, of the District of Columbia, and minister to Hayti. The latter, for various reasons, afforded small chance for distinction, but in the others he acquitted himself with dignity and success. Naturally, he was a strong advocate of negro suffrage, but he never ceased to urge upon the members of his race the need of attaining industrial efficiency. Mr. Washington, whose statesmanlike treatment of the negro question and admitted oratorical power make him in these respects a worthy successor to Douglass, writes with commendable simplicity and moderation, offering no apologies for the mistakes of Douglass's career, and neither denouncing the slavery advocates nor covering with excessive praise the Abolitionists. The appearance of such a book by such a writer is a significantly hopeful sign.

Two essays in Vol. XV., No. 2, of the Modern Language Association for June, should be of special interest to Americans: "On the Conservatism of Language in a New Country," by Frank Egbert Bryant, and "Chateaubriand's America," by Emma Kate Armstrong. Founding his discussion on a statement by Ellis in his "Early English Pronunciation," made in 1869, that the language of a colony is almost always more conservative than that of its mother country, and that American English is archaic in respect to that of British English, Mr. Bryant maintains that "it has not been and cannot be proved that Americans speak a more archaic English than the people of Great Britain," contending that there is not the least probability that immigration in itself is a conservative force. Miss Armstrong's study of Chateaubriand has to do especially with his arrival in, and first impressions of America, and this, of course, opens the old question, discussed pro and con by Bédier, Stathers, Dick, and others, as to whether Chateaubriand, in five months, really travelled from Baltimore to Niagara, then to the Gulf of Mexico and back to Philadelphia, and whether he met Washington on the journey, as he describes. The amount of what Miss Armstrong has *festgestellt* is not great, but it is something. She searched Washington's papers in the Library of Congress, and says: "To sum up, a careful examination of Chateaubriand's works shows that two of his statements about his visit to America may be accepted without hesitation: he came to Baltimore, and his letter of introduction from the Marquis de la Rouërie was received by Washington." Mr. William Guild Howard contributes an interesting paper on Schiller and Hebbel, in which he seeks to prove that "the decisive moment in Hebbel's life was the moment of his escape from thraldom to the rhetorical sentimentality of Schiller," and that while Hebbel recognized the merits of Schiller's "Jungfrau von Orleans," he was not directly influenced by Schiller in the disposition of his matter for "Judith." Other essays in the number are: "The Objectivity of the Ghosts in Shakespeare," by Elmer Edgar Stoll; "The Story of Grisandole: A Study in the Legend of Merlin," by Lucy Allen Paton; "Doni and the Jacobeans," by John M. Berdan; and "Dryden's Conversion to the Roman Catholic Faith," by Robert K. Root.

LADY MARY.

Lady Mary Wortley Montagu and Her Times. By George Paston. New York: G. P. Putnam's Sons. $4.50 net.

Miss E. M. Symonds, who writes pleasantly under the name of "George Paston," has given us in this volume both an interesting and a valuable contribution to the happily increasing literature that deals with the manners and tastes, the books and personages of the much berated but to its lovers always fascinating eighteenth century. When she undertook her task she had little hope that she would make any considerable gleanings, but, thanks to the Earl of Harrowby, she was allowed to examine the manuscripts at Sandon Hall, where she found "four or five hundred unpublished letters," upwards of a hundred being from Lady Mary and about half as many from that famous woman's inimitable spouse, whom his friends often called Mr. Wortley. As Lady Mary's Diary has been beyond recall since 1794, when her daughter, Lady Bute, with a discretion as admirable as it was lamentable, committed it to the flames, no better "find" can reasonably have been expected by any admirer of Pope's witty antagonist, if admirers she still has.

Whether our biographer has made a proper use of her treasure-trove is a question that admits of some discussion. She has given certain letters entire, abridged others, and digested still a larger number into a smoothly running narrative, with the result that the book is pleasant reading, and that we feel we have been "personally conducted" over an interesting tract of time, to say nothing of the fascinating though not precisely charming region constituted by the life and character, the mind and heart, of one of the most distinguished and brilliant women known to history. In other words, this biography has been written for the general reader rather than for the student, a fact which does not absolve us, however, from the duty of asking whether it might not have been profitably shortened by some two hundred pages.

On the other hand, the student and the insatiate lover of the eighteenth century is almost bound to wish that the correspondence had been published intact, with just enough annotation and interpolated text to save it from being as forbidding as a report of the Historical Manuscripts Commission. No excising editor can ever know what a scholar may need, just as few of them seem to know what the public will stand. There will always be trouble about such discoveries in connection with men and subjects in which both the public and scholars are interested; but there is surely no occasion to argue the matter here.

It is equally true that one ought not, as a rule, to look a gift horse too closely in the mouth. Yet what can one do but closely scrutinize the work of a biographer who begins her book by misdating the birth of her heroine by a century! Careless proofreading, of course; yet how far does it extend? So far as the present reviewer can determine, after pretty thorough tests, the carelessness, while rather disgraceful, does not detract greatly from the value of the book. It is absurd, for instance, to read of John Morris (of Bemerton), of the *Quarterly Review* for February, 1737; it is desirable to spell consistently in the text—cf. Stuart (p. 504) and Steuart (p. 505)—it is worth while to give correctly the Christian names of the diarist Evelyn and of the father of the notorious Mrs. Manley—but these defects are, after all, trifles. It is disconcerting to find three errors in the notes to a single page (13), but perhaps we should be satisfied on finding that there is only one instance of a note's being absent after we have been directed to look for it, and an examination of a large number of the notes leads to the conclusion that the three errors to a page was a case of exceptional sleepiness on the part of the

author, the proofreader, or both. The annotation is a little capricious, rather commonplace, and too frequently slovenly; but there are not so many departures from the dates and titles furnished by the Dictionary of National Biography as the errors first detected led us to expect.

And the good things of the volume abundantly compensate for the defects—so abundantly, indeed, that one is at a loss how to describe or enumerate them. Lady Mary's dazzling girlhood and her unparalleled experiences with her lover, Mr. Wortley, occupy over a fourth of the space, and give the reader of psychological bias much occasion for reflection. If there was ever a suitor that deserved to fail, if there was ever an unmagnetic and disagreeable, not to say, contemptible, hero of what ought to have been a romance, Mr. Wortley Montagu may safely be named to fill the position, despite the fact that he was the friend of Joseph Addison, and, what is more, of Richard Steele. If Pope and Horace Walpole were justified in assailing Lady Mary's morals in a tender point—this volume leaves that question still an open one—Mr. Wortley deserves no commiseration. His letters before the elopement dealt once, at least, with the possibility of what Lady Mary's enemies treated as an actuality, but that is not the most surprising or repulsive feature of his side of the correspondence. To use a homely phrase, both lovers, before they finally eloped, "backed and filled" to an extent that one would pronounce unnatural and impossible were these letters found in an eighteenth century novel; but, while Mr. Wortley seems scarcely human, Lady Mary is apparently more womanly than she shows herself to be at any later period. Her head, stuffed with knowledge kept in motion by her wit, was always more in evidence than her heart; but her early letters prove that she began life with that invisible organ in a healthy condition, and that somehow Mr. Wortley managed to control its movements and to get them thoroughly out of order. One would give a good deal to have been present at one of those clandestine meetings at Mrs. Steele's, in order to judge, if possible what trick of glance or speech, what feature of personality, made Lady Mary ready to brave her father's wrath and to overlook the thousand and one unattractive qualities of her middle-aged admirer. One is not so anxious to look in on her as a deserted bride at Huntingdon or York, though one is interested in reading details about the renting of country houses in 1713. That she should have been deserted does not surprise us, when we read this exhortation addressed to her by her would-be husband on the eve of their elopement: "If we should once get into a coach, let us not say one word till we come before the parson, least we should engage in fresh disputes." So careful a gentleman might well, as the story goes, have written out a speech which he intended to read from his hat, and have inserted in the margin such hints as "Here pause a minute," "look round," "low," "loud," "cough."

Of the pages and chapters describing the life of Lady Mary, the notorious woman of the world, the traveller, the philanthropical advocate of inoculation, the flame and then the far from defenceless victim of Pope, the exile of Italy and France, the eccentric old personage described by Walpole, it is impossible to speak adequately within the space of any less leisurely review than those our grandfathers tolerated. Although Miss Symonds makes the letters tell the story well, she can scarcely be said to add, in the second half of her book, anything very important to our knowledge either of Lady Mary or of her times. But she makes available her mass of material, and she treats with fairness and thoroughness such episodes as the affair with the French intriguer Rémond, and the quarrel with Pope. Moreover, she furnishes scores of interesting passages which will be useful to writers on manners and to discursive editors of the type of the late Dr. Birkbeck Hill. One's pencil is kept busy marking the tid-bits.

For example, we are carried back to the age of "The Rape of the Lock," when we find Mr. Secretary Craggs meeting Lady Mary at the foot of the great stairs after she had reluctantly left the King's presence to keep an engagement, and, on hearing of her plight, catching her in his arms, running with her upstairs, and depositing her in the ante-chamber! The manners and morals of the Vienna ladies of 1716 interest us quite as much as they did the wife of the soon-recalled ambassador to Turkey. On the other hand, we can but wonder at her failure to recognize the greatness of "Gulliver's Travels," and the genius of Swift, whether or not we share her antipathy for that wonderful man's character. It is pleasanter to find that she wrote in her cousin Fielding's "Tom Jones" "*Ne plus ultra*," and on reading "Joseph Andrews" liked that better. If we are fond of parallels, we can compare the tactics of the gallant ladies, headed by the Duchess of Queensberry (Prior's Kitty), who managed to hear a debate in the Lords, despite an order from the Chancellor not to admit them, with the methods employed in our own day by the virgin martyrs who try to storm the lower house. It is interesting to learn that in 1739 one of the drawbacks to Continental travelling was the constant risk one ran of meeting Englishmen, and we sympathize with Lady Mary when she objects to having her trunks examined on her return to her native land after an exile of over twenty years. But sympathy is out of the question when we recall her attitude toward her scapegrace son. Despite his linguistic attainments he was surely afflicted with some mental disorder, and, whether she could understand this or not, and whatever the shocks he gave her pride, no true mother—nay, no woman worthy of respect—should have written to and about him as Lady Mary did. One can forgive her coarseness, her hardness, her miserliness; one can dismiss the strictures of Pope and Walpole as slanders; one can admire her learning, her pleas for the better education of her sex, and her later relations with her daughter, Lady Bute; but one is forced to draw the line at pardoning the woman who could write his sister these words about her own son:

> A few days before, I received from an unknown hand, without any letter of advice, a very nonsensical book, printed with your brother's name to it, which only serves to show me that he has private correspondencies here, and that he is still a Knavish Fool.

"Folly (as Mons. Rochefoucault remarks) is the only incorrigible fault." So wrote Lady Mary on another occasion, and the folly of Edward Wortley Montagu, the polyglot traveller and polygamist, seems to have borne out the French Moralist. His chagrined parent was as little of a fool as any Englishwoman has ever been, but she was something much worse. She was an unfeeling mother who made the cynical remark about her son's wife—or rather one of his wives—that she was "too old to attract gallants and not rich enough to buy them." Is it any wonder that to-day Lady Mary is for most people merely the woman who introduced inoculation into England, and called Pope "the wicked wasp of Twickenham"?

CURRENT FICTION.

The Letters of One. By Charles Hare Plunkett. New York: G. P. Putnam's Sons.

An interesting study of a morbid and irritating type. The writer of the letters is a small author who "lives for his art." The only original thing about him is that he claims little for his product, does not even fancy that he is about to produce masterpieces. Yet he prides himself upon his status as an artist, and is complacent in sacrificing everything and everybody else to the maintenance of that status. The principal victim is the woman to whom the letters are addressed. Knowing that she is inclined to marry him, he decides coolly to stay away from her and bait her with correspondence. A more subtly devised insult to any healthy and sensitive woman than the series of communications which follow, it would be hard to imagine. The pleasure of fidgeting and dawdling over his precious little literary exercises is evidently enhanced by the delicate spectacle of her distress. She has wealth and health and a loving heart, but he prefers to hug his poverty, his valetudinary habit, his idle and selfish dreams. And to this voluptuousness of the artist he adds the voluptuousness of the celibate; there is a touch of grossness in his very abnegations. The end of it all is reassuring. The man has promised the woman from the outset that he will come to her if she insists. As a final test, one supposes, she summons him. Follows a fatuous letter from him, thanking her for her kindness. She has been wonderfully good to him during the risky interview; she has, in effect, done nothing to compromise him! "Whatever may befall us, there is that between us which I hardly dare think—your perfect and wise acquiescence, your determination to let me do what I thought right." Here, obviously, is the perfect woman—one who will yearn for him indefinitely—at a definite distance. But the interview has, curiously enough, been less gratifying to the lady. The next letter is a reply to one from her announcing that she has decided to have nothing further to do with him. This, he says, is a terrible shock; he has neither eaten nor slept since receiving it. As a matter of fact, though his vanity is hurt, he evidently enjoys the situation. Whereupon "Poor-me's" and "God-bless-you's" follow each other tumultuously, and the correspondence ends with a creditable burst of rhetoric. In the introduction to the letters it is hinted that the lady is not permanently uncon-

soled; and as the gentleman has only insisted upon being miserable, there is nothing for any one to complain of. The business sounds rather farcical when reduced to these terms; but as a *reductio ad absurdum* of the artistic temperament theory, the book has merit.

Fräulein Schmidt and Mr. Anstruther. By the Author of "Elizabeth and her German Garden." New York: Charles Scribner's Sons.

There are two reasons for missing nothing that comes from the pen of this lady. The first is that her stories beget an almost sinful content with one's own place of abode, if only it be out of the Fatherland. Not Frau Buchholtz herself drew a more repulsive picture of honest bourgeois life, with its hideous concentration upon kitchen matters, and its distrust of all beyond its immediate ken.

Like Hildegarde of "The Initials," Fräulein Schmidt has a stepmother, who takes boarders. Like that Hamilton who was beloved by a whole past generation of mothers, Mr. Anstruther comes from a fashionable English circle, to improve his German. Like Hamilton, he offers marriage to his landlady's daughter. Here the parallel ceases. Fräulein Schmidt's letters form the only narrative, and it must be confessed that they rather suggest "Elizabeth" than a girl brought up in a poor household in Jena. Still, as the letters are undeniably good reading, this remark should be taken as a comment, not a criticism. England proves too much for Roger, England represented by a rich *partie* and his father's displeasure. Fräulein Schmidt has the rare courage and taste to wish to keep her faithless lover as a friend, and, truly, this is necessary, or where would the rest of the book have been, with its humorous descriptions, its pretty bits of scenery, its reflections upon life and literature?

In the end, Roger breaks with his rich Miss Cheriton and wishes to be taken back. At this point the author consults poetical justice before probability. Though chained to the grim fate of a dowerless girl in Germany, Rose-Marie Schmidt, having outgrown Roger, finds strength of soul to refuse him. Now, to use a big word, here is a psychological impossibility. "Elizabeth" with her talent for perversity might have done this. Not so the perfectly unembittered Rose-Marie! Still, one is quite free to believe that even if the book be ended, the story may perhaps go on, more normally. And after all, this is a minor matter, since (the second reason for reading them) these letters themselves, while slight, make a thoroughly acceptable bit of summer diversion.

The Haunters of the Silences. By Charles G. D. Roberts. Boston: L. C. Page & Co.

Some years ago, when Mr. Burroughs fell upon Mr. Long, as it were, out of a clear sky, the incredible thing happened. So far as we recall, not a single naturalist of standing appeared in Mr. Long's defence; and the sale of Mr. Long's books at once increased enormously. Rejected of his fellows, town libraries clamored to take him in, even as they would be taken in, and school committees adopted him with enthusiasm. So he became the idol of whopper-loving childhood, the cynosure of the kindergartner, and the prophet of the lady with the bird-glass. Now that the President has laid hand to him, there is no knowing where he may stop. Mr. Roberts, to be sure, is the immediate target; we may congratulate him upon the substantial damages which a good-natured populace has begun already, no doubt, to pour into his lap. Who would not rather have the President call him a liar than a poet? Upon the technical points involved in the controversy, a layman had better not express an opinion. He does not know how a lynx kills a wolf, and does not so much care, so long as the blood flows. He does not go to a book like "The Haunters of the Silences" for precise information as to the habits of animals. He goes to it because he likes good stories, including fish stories. His interest in the animal story may be waning a bit; for the "nature" writers are in the way of running into the ground their fable of tooth and claw. And it may seem to him reasonable that, after the story is told, after the effect has been gained, the fabulist should now and then own frankly that whopper is the word.

The Wooing of Tokala. By Franklin Wells Calkins. New York: Fleming H. Revell Co.

With only a thread of story, in the conventional sense, this is a thoroughly competent study of a group of Dakotah and Sioux Indians. Their habits, traditions, and point of view are given with a detail which though painstaking is never tiresome. Mr. Calkins loves his red men. Their individuality, their humanity, is strongly borne in upon him, and the modern way of looking at all the mysteries of folk lore enables him both to understand and to interpret. He never loses the attitude of Indian towards Indian and towards white men. Having set himself to describing the whole condition from the other side, the Dakotahs', he actually succeeds in keeping up the illusion without a break. He makes his Indians quite plain, as creatures in the toils of tradition and beliefs which they must obey. His style is clear and simple, attaining excellent effects by dint of completely avoiding self-conscious and labored efforts. In fact, the whole book contains matter of real interest, which is conveyed without parade of knowledge and with a total absence of trick or mannerism.

Dulcibel: A Tale of Old Salem. By Henry Peterson. Philadelphia: The John C. Winston Co.

If any reader desires to forget recent higher criticism of the Salem persecutions for witchcraft let him turn to Mr. Peterson's story. Rehabilitations in the light of modern research, reversals of judgment, the mantle of allowance for the day and the dogma, will all be forgotten while he abandons himself to the easy task of unmitigated abhorrence. The tale is not without its crudities, but it is animated and full of zeal. With every allowance for partisanship it is a stirring recital, and pulls at the nerves of indignation as if the dreadful thing had not all happened two hundred years ago.

Structure and Growth of the Mind. By W. Mitchell. New York: Macmillan & Co. $2.60 net.

This is a treatise on descriptive and genetic psychology. It is presented in a series of lectures which were composed, as the author says, to be read as well as heard. The discursive style and the absence of prominent landmarks would often give the reader a rather vague idea of the plan of exposition, were it not for the table of contents, which is a model of scientific analysis, and almost makes up for the absence of an alphabetical index. The first lecture and the last are concerned with questions of physiological psychology. The author begins with a discussion of "Mind and Brain," and this forms, we think, the best chapter in the book. He disposes easily of materialism, as so many psychologists before him have done. He then takes up the theory of "parallelism," which at present is being extensively defended and attacked by metaphysicians and psychologists. Do physical and psychical processes act and react upon one another, or have we to do with two totally distinct, yet parallel, series of phenomena, which, although not interacting, correspond as two clocks might correspond with each other? Professor Mitchell maintains that physical, as well as psychical, phenomena are all modifications of mind. All our direct experience is of mental, not of material, changes. The latter are abstractions. There are not two series parallel to each other—one psychical, the other physical; there is a single series. For the idealistic metaphysician there is no "parallelism," inasmuch as direct experience is of the psychical only. Nevertheless, as the author points out, this does not preclude the psychologist from demonstrating a correspondence between certain modifications of the brain, and certain states of which we are directly conscious. The greater part of the volume is devoted to an explanation and analysis of this direct experience.

There are three chapters on "sympathetic and æsthetic intelligence." Of these, the first is concerned with "imitation," to which the author does not attach the importance given to it by Tarde and Baldwin as a means of mental development; the second and third contain explanations of the way in which self reads itself into experience, and becomes absorbed in it. The growth of intelligence is treated according to a threefold division of the latter into "sensory," "perceptual," and "conceptual." The concluding lecture leaves the "direct" and takes up the "indirect" explanation of experience. This can be read with understanding only by those who have some knowledge of the nervous system. Professor Mitchell gives a plausible account of the localization of the functions of the brain; but the territory is difficult for the traveller, and the further one goes, the further the frontier of certainty seems to recede.

In general, the point of view taken in these lectures is that of moderate pragmatism. The author holds that he has "a single task at all grades," and "at all of them the criterion of truth is the system of truth to which it claims to belong. The development of knowledge is by a tentative seeking of what will work with-

in the system." Unlike most modern psychologists, he has no scruples about using the term "faculty," which he defines as "a power to experience"; but he does not always adhere to this definition, as when he calls "sympathy" a faculty. And his explanation of the way in which we become aware of the existence of faculties is obscure, for he observes: "The explanation of a faculty consists in analyzing it not into anything that we experience, but into the conditions of the experience after which it is named." A faculty "is a power to achieve experience by means that we do not experience."

The plan followed by the author throughout is to consider first our experience of things; second, our thought about them, and last, our action in consequence of our thought and interest. This analysis may be accommodated to the traditional division of mental processes into those of knowing, feeling, and willing. In every process, self is an element; and Professor Mitchell has no sympathy apparently with the associational psychology, which would explain one experience by another. He thinks that the active self must always be considered in every mental change. This point does not seem to be of much psychological importance. For if the self be regarded as something which changes at every moment of consciousness, then we may disregard it, and examine the states of consciousness as such. If, on the contrary, it is a common factor which remains unchanged in every experience, then it may be eliminated. At all events, it is misleading to speak as the author does of our consciousness of "self-activity" without removing the obscurity which surrounds the conception of "activity" in general, and of "self-activity" in particular. Mr. Bradley long ago found fault with the abuse of the word "activity," which he regarded as a "scandal" in philosophy. Indeed, it would be well if those who employ the term would either define it, or else admit that it is indefinable. As for "self-activity," it is used even more vaguely.

These lectures resemble not so much the precise and well-guarded treatises on psychology of the last two decades, as they do a modernized form of those discourses which once attracted, informed, and delighted the audiences at the Scotch universities during the days of Dugald Stewart and Thomas Brown. Professor Mitchell has made a good contribution to psychology, and indirectly to pedagogy; and that will be recognized even by readers who dissent from his conclusions.

Race Prejudice. By Jean Finot. Translated by Florence Wade-Evans. New York: E. P. Dutton & Co. $3 net.

M. Finot is an apostle of international and interracial friendship. Holding that one great obstacle, indeed the greatest obstacle, in the way of the establishment of kindly relations between human communities is the belief in the existence of insurmountable racial differences and antagonisms, he sets himself to show that the diversities that exist are neither fundamental nor necessarily permanent. With the term "race" he has little difficulty—no one now holds that the word can be taken to mean an absolutely unitary and fixed social group. He goes into detail, however, on the question, examining, with a large array of authorities, the various proposed divisions of humanity based on shape and size of skull, length of limbs, color of skin, and other physical differences, and deciding that in these regards there is no visible line of demarcation between human groups. Here he is too positive; the trustworthy statistics thus far published are not large enough to warrant his sweeping generalization; still, the facts he adduces go to diminish the significance of the physical differences between peoples and between other groups. On the other hand, he points out the influences that make for the unity of the human type: the conditions of climate and food, the crossing of races, and the law of organic coördination, according to which changes in one organ affect all others. Striking examples of the effect of these influences may be given, such as the growth of the Hungarian people out of a Turkish nucleus, the mixed character of the English, and in this country the rapid Americanization of large bodies of immigrants of diverse types. Here again, with much that is sound, the author is disposed to accept too hastily poorly authenticated reports of the results of cross-breeding in the lower human groups.

M. Finot's main purpose is to set aside the current opinion that the "Latin" peoples, and especially the French, are essentially different from the other peoples of Europe, and to show that there is no reason for relegating negroes to a permanently low place, intellectually and culturally, among human races. France, he says, while at bottom not Celtic, but Germanic, has the most mixed population and the greatest variety of soils of any European country, and it is precisely for this reason that she is the leader of civilization in Europe, the land where human equality is most recognized, the centre whence ideas spread over Europe and America. Not calling in question the cultural primacy of France (a primacy long ago claimed for her by Guizot and others), and accepting for the moment the statement as to the character of her population (though this is doubtful), the author's conclusion does not certainly follow; national character and national achievement are things too complicated to be explained in so summary a manner, as he himself admits in his sketch of the discordant opinions that have been expressed concerning the Celtic genius. However, his exposition of the French civilization is instructive, and his object will have been gained if it be recognized (as recognized it must be) that it is no longer possible to divide all human psychological material into "French nature and human nature."

His championship of the negro is based in part on a precarious ethnological theory—the white race, he says (p. 99), is the direct fruit of a negro race. True, some ethnologists hold that Europe was settled by a North African stock; but this supposition is by no means proved, and if it were proved, the character of the stock in question is unknown. He is on safer ground when he points to the industrial and cultural progress of negroes in this country, though it should be added that this progress has been made entirely under white tutelage. All friends of the negro welcome his growth in capacity, and insist that he shall have equality of opportunity; but it is too soon to maintain, as M. Finot does, that he is in all respects the equal of the white man—only time can decide this question. M. Finot, further, is firmly convinced that the American white race is moving physically toward the Redskin type—leather-like skin, muddy tint (among woman insipid pallor), small head covered with smooth dark hair, long neck, sunken eyes, with dark iris, elongated bones of the extremities (in women unmelodious voice, thinness, precocious physical and intellectual development). This point may be left to somatologists to decide.

It may be hoped that M. Finot's book will help to dispel race prejudice and to further the sentiment of human unity. One cannot, indeed, share his optimistic expectations to the full. Granted that the term "race" represents merely a hypothetical limit and not a concrete reality, it remains true that mankind is divided into communities that are concrete and real, every one regarding itself as an independent unit, and every one working for its own advantage. This narrow self-regarding attitude may be modified by the abolition of the dogma of racial antagonism, but for complete regeneration we must look to the larger influences that spring from close companionship and the sense of identity of interests—it is, in fact, this last that will destroy the feeling of antagonism.

M. Finot's volume, while it does not escape the exaggeration natural to an enthusiastic advocate, contains much matter that is of interest to students of international relations and racial history.

Haddon. The Manor, the Hall, its Lords and Traditions. By G. LeBlanc Smith. London: Elliot Stock.

Haddon Hall has so long been the property of tourists, novelists, and playwrights, that a time has come when the archæologist may fitly claim his share in this delightful memorial of the past. To be sure, a certain amount of history must needs be woven into any tale of Dorothy Vernon and her elopement. But then the elopement is a complete myth, and it remains for the present historian to give us in its soberer, more authentic form, the annals of this ancient place. His book on Haddon is a volume of nearly 170 pages, in which, amid copious illustrations, is told the story of the Peverels, the Avenels, the Vernons, and the Mannerses, as it centres around one of the most famous buildings in England.

Haddon, like every other respectable manor, goes back to Domesday, where it figures in close association with Bakewell. Shortly after the Conquest, it was granted by William to his natural son, William Peverel, in whose family a part of it remained until the fourth Peverel forfeited his lands to the first of the Plantagenets. In the meantime, however, the greater part of the manor, including the Hall, had been granted by the second Peverel to a knight named Avenel. By a singular arrangement effected about 1170, William of Avenel divided all his possessions at death between his two sons-in-law, Richard de Vernon and Simon Basset, the two "sharing equal-

ly everywhere and in all things as my heirs, and so that Simon Basset and his heirs shall do to Richard de Vernon and his heirs what the younger shall own to the elder." Eventually, the Vernons bought out the interest of the Bassets in Haddon, and the estate remained their property in the male line until 1565, when Sir George Vernon died, leaving two daughters. The younger of these was the celebrated Dorothy, who carried Haddon as part of her dower to John Manners, second son of the first Earl of Rutland.

As for the incident with which Dorothy Vernon is chiefly connected in legend, Mr. Smith says: "There is not one particle of historical or documentary evidence to support the tale of elopement." He furthermore observes: "The amount of truth contained in this undoubtedly pretty tale may be gauged from the fact that the very room in which she was supposed to have been dancing, and the actual steps down which she is said to have fled, were built by her husband John Manners, when he married her and became possessed of the Haddon estates." There are several other points about Haddon and its owners which Mr. Smith is at pains to clear up. One of these is that all the later Vernons were descended from a certain Gilbert le Franceis, who married a Vernon heiress, and whose sons assumed the Vernon name. There is at Haddon a so-called confessional, which the local guide always associates with pre-Reformation days. As a matter of fact, it never was a confessional at all, and dates only from the seventeenth century. "This," says Mr. Smith, "like Dorothy Vernon's elopement, is another Haddon fable."

The true antiquarian is so filled with the romance of his subject that he has little patience for those who demand the pseudo-romance of melodrama. In the present case Mr. Smith does nothing to embellish his theme by any attempt at fine writing. It is enough that he should set down correctly the leading events in manorial annals and make notes upon the chief objects of interest that are still preserved within the hall. But for those who wish to *know*, this book is worth all the loosely written trash about Haddon, put together. We submit, however, that Mr. Smith would do well to avoid a common misquotation when he writes at the foot of his dedication:

Si monumentum quaris, circumspice.

Apropos of this volume, we wish to say a word on behalf of the American tourist whose vagaries and vandalism are so often held up to ridicule and abuse. It does, indeed, happen from time to time that some one, like the late Rev. Mr. Talmage, goes abroad with a geological hammer to knock relics off the corners of ancient and venerated buildings. The verses of J. K. Stephen, entitled, "On a Rhine Steamer," are also not without a certain justification. But we would fain protest against an indiscriminate tirade against those from our side of the Atlantic who during six months of the year infest the English inn and wander about the English ruin. The next time the reader hears American tourists denounced abusively, let him remember, though he need not cite, the following passage from the preface to Mr. Smith's book on Haddon Hall:

Large numbers of Americans visit Haddon every year, and take the greatest interest in everything shown them, besides displaying far more intelligence than the average Briton, who is perfectly content to amuse himself by endeavoring to inscribe his name on every wall or anything inscribable, despite forbidding notices, when the guide's back is turned or attention is in any way diverted. The American seems to come to learn, while our countrymen come to enjoy themselves in any way, rowdy or otherwise, that they can.

The King of Court Poets. A Study of the Work, Life, and Times of Lodovico Ariosto. By Edmund G. Gardner. New York: E. P. Dutton & Co. $4 net.

Mr. Gardner has won a high place in the esteem of students of Italian literature and travellers in Italy, in the first instance by his excellent "Dante Primer" and "Dante's Ten Heavens," and in the second by his books on Florence and Siena in Dent's Mediæval Towns series. In his "Dukes and Poets in Ferrara," and in the present volume, he has attempted a combination of political and literary history; but we cannot think that these two epochs have been happily chosen for such an attempt. There are periods in which political events may be grouped about the writings and personalities of literary men. Cases in point are Masson's "Life of Milton" and Villari's "Life and Times of Machiavelli," and any adequate political history of the Italian Risorgimento must also be a library history of the same era. But neither the men nor the events with which Mr. Gardner deals can be compared to those which we have cited. "In the earlier epoch of Ferrarese history," says Mr. Gardner, "the princes of the House of Este—and, above all, the first Duke Ercole—are far more interesting than the poets who sang their praises. But in this second period Ariosto becomes an incomparably more attractive and engaging figure than either Cardinal Ippolito or Duke Alfonso." This is true enough, but Ariosto, accomplished court poet though he was, even King of Court Poets, according to our author's title, and often as he was employed on public business, had little influence upon the political moves in which he played a part. He was never anything more than a legate or emissary, with definite instruction to control his acts.

For this reason different portions of the book, as they deal with political or literary history, read as if they belonged to different studies, and were bound together by mistake. Chapters iv, vi, viii, and ix, which together form the largest and most important of the purely historical parts, have little to do with Ariosto. But more than this, Mr. Gardner has not shown himself in his two later ventures to be a good writer of history. Both of them leave no question of his diligence in research, but they also betray his imperfect mastery of the art of historical perspective. We can almost see him in the act of transferring the materials directly from the archives to his pages. Whereas, in his popular books on Florence and Siena he showed that he could write a clear and entertaining historical brief when he depended on others for his facts, his writing here is not only without distinction, but is sometimes positively bad. There are all too many sentences like this: "Count Niccolò Ariosti was at Lugo, as ducal commissary in Romagna, when in the November of this year, 1496, he put an innocent man to the torture in order to make him deliver up to justice the name of a villain who had done him wrong, whom, for the sake of his own honor, he was shielding."

Mr. Gardner is at his best in dealing with Ariosto's personal and literary history. Chapters xi, xii, and xiii, under the respective titles of "The Orlando Furioso," "Ariosto's Minor Poems," and "Ariosto's Comedies," are all good, especially the twelfth. The influence of the poet's predecessors and contemporaries, and the growth and development of his own art, are set forth with insight, while epitomes and long quotations, nearly always accompanied by translations, make the treatment easy to follow, even when a text of the author is not at hand. But here again a serious defect is the almost complete failure to consider Ariosto's versification from the formal and historical points of view. His invention of a new comic rhythm, the dodecasyllabic *verso sdrucciolo*, is indeed mentioned (p. 331), as also the fact that in his one undoubted canzone of the regular type, the pauses in sense do not correspond with the metrical periods (p. 298). But there is never a word said about the history of the *ottava rima*, the form which is so characteristic of the Italian epic, and over which Ariosto won so perfect a command.

We wish to draw attention to a discriminating passage in Mr. Gardner's criticism of the "Orlando" (pp. 266 ff.), in which he rightly rejects the judgment of Tasso that the two "Orlandos"—Boiardo's "Innamorato" and Ariosto's "Furioso"—should be considered as a single complete poem, begun by the one and brought to an end with greater artistic power by the other poet. Mr. Gardner justly observes that the two poems belong to entirely different categories in art:

> The one is a chivalrous romance written in verse, the other is a romantic epic. "The true culminating point in the history of the Italian romance of chivalry," writes Pio Rajna, "is represented by the first, rather than by the second 'Orlando.' With the poem of the Count of Scandiano ends the natural and spontaneous development of the genus. With the 'Furioso,' born of an Italian father, but of a Latin mother, there begins in the stem another branch, which, if it still recognizes the 'Chanson de Roland' and the 'Roman de Tristan' among its ancestors, nevertheless derives a good part of its blood from the 'Æneid,' from the 'Metamorphoses,' and from the 'Thebaid.'"

Mr. Gardner's phrase, "chivalrous romance," instead of "romance of chivalry," may not be commended, but his distinction, as suggested by Rajna, is a valid one. And a striking evidence of Ariosto's indebtedness to the ancients is his delight in episodic narrative, which, though never wholly irrelevant, nevertheless obstructs the main current of the fable. In fact, an interesting essay in comparative literature might be written on the episodic element in epic poetry.

Mr. Gardner's versions are usually accurate, but he has made a few slips in translating his author's *Carm.* i, 11, as quoted on page 293. "Celebres" in the line, "Et Satyros inter celebres Dryadasque puellas," means not "renowned," but "thronging." "Dum vaga mens aliud poscat" is rendered "Whilst my roving mind asks other things"; but the correct sense is, "Until my roving fancy ask a change." In translating "Qui-

bus parili vita tenore fluit," "Ye for whom life flows in *rigid* tenour," Mr. Gardner probably derives the notion of "rigid" from "Catones" in the preceding line rather than from "parili," which here has the meaning of "monotonous."

The book is provided with a full bibliography and index, and is beautifully made up. The frontispiece is from the woodcut after Titian's design, which was published in the Ferrara edition of the "Orlando" of 1532. There are besides eight illustrations in the text from contemporary medals and paintings.

Die Geheimlehre des Veda. By Paul Deussen. Leipzig: F. A. Brockhaus.

Erinnerungen an Indien. By Paul Deussen. Kiel: Lipsius & Tischer.

In his "Secret Doctrine of the Veda" the distinguished professor of philosophy in the University of Kiel aims to reveal the esoteric teachings of the Veda by a careful and quite exhaustive collection of passages from it and from the commentaries of Indian exegetists, especially from the Upanishads. The Bible ascribes the fall of man to the corruption and perversion of his will, which brought him under the hereditary dominion of sin; the Veda, he says, discovers the origin of human errors and delinquencies in ignorance. The former finds ransom through the mediatorial transformation of the will; the latter secures redemption through enlightenment and the enlargement of the perceptive faculties. In the words of Shakespeare,

> Ignorance is the curse of God,
> Knowledge the wing wherewith we fly to heaven.

But since man is neither wholly will nor wholly intellect, the two schemes of redemption supplement and elucidate each other.

The secret doctrine which the author discovers in the Veda and expounds is that of the *Âtman*, the principle of life, sensation, and intelligence, which has its highest impersonal manifestation in Brahma, the supreme deity and soul of the universe, and which constitutes the essence, entity, and imperishable self of every individual. This doctrine was taught by Çankara, the celebrated interpreter of the Vedânta philosophy, by Plato, Kant, and Schopenhauer, and finds concise expression in Descartes's "cogito, ergo sum," corresponding essentially to the Sanskrit "aham Brahma asmi," I am Brahma. All else is illusion (*mâyâ*). We cannot here give even a succinct survey of the contents of this volume, but can commend it to all who may be interested in the subject. Professor Deussen, we may add, is the ablest living exponent of Hindu Philosophy, but in reading his work one must allow for a certain perversion of the naïve spirituality of the more ancient India through his Teutonic intellectualism.

His "Recollections of India" is a work of more general interest, but also of special value to Oriental scholars. It contains delightful reminiscences of a journey in India extending from Bombay to Peshawar in the extreme north, thence to Calcutta, and through central India, back to Bombay, including a remarkable excursion in the Himalayas and a tour to Madras and Ceylon. Professor Deussen was accompanied by his wife. They both speak English, and were thus enabled to converse with the officials and British residents, while his knowledge of Sanskrit and Hindi facilitated his intercourse with native scholars and the common people. Indeed, since his return he has kept up a correspondence in Sanskrit with some of his learned friends there, who address him as Devasena, a quite complimentary orthographic form of his name, since it implies a connection with the celestial hosts.

These rare qualifications brought him into more or less familiar association with all classes—rulers, priests, pandits, and persons of every caste from Brahmins to Sudras. It is hardly necessary to add that this volume of 256 pages gives a more varied and more accurate description of the country and its heterogeneous inhabitants, their thoughts, feelings, occupations, and conditions in ordinary life, as well as their ideas embodied in philosophic systems and religious tenets, than any other record of travel in that remote region. Obscure places, which have no interest for the average tourist, are full of significance and suggestiveness to him through the allusions to them in the "Rigveda," the "Mahâbhârata," and other monuments of Sanskrit literature. At the same time he shows strong practical sense and often delicious humor in the narration of his daily experiences. He praises the organization and construction of the railways and the arrangements for the comfort of the passengers. The hotels are very defective, and in many smaller towns there are no inns whatever, and the Government has erected so-called dawk-bungalows at the stations for the travellers, or prepares beds in the waiting rooms or in empty cars. Although these makeshifts furnish rather primitive accommodations, they are preferable to the average hotels. In Lucknow he took a cab, or *ekka*, which he calls "the most wretched vehicle I ever sat in." Its name seems at first to be a corruption of hack, but is really from the Sanskrit *eka*, single, one-horse shay; its disagreeable jerking and jolting, however, might sugest *aka*, moving tortuously or jostling to and fro.

The book has a map of India and sixteen illustrations with an appendix containing a lecture in English "On the Philosophy of the Vedânta and Its Relations to Occidental Metaphysics," delivered before the Royal Asiatic Society in Bombay.

The Arthur of the English Poets. By Howard Maynadier. Boston: Houghton, Mifflin & Co. $1.50 net.

This is an excellent book and is likely to supersede M. W. MacCallum's "Tennyson's Idylls and Arthurian Story," which has long done good service as the best popular account of the development of the Arthurian legend in the Middle Ages, and its treatment by the English poets. To be sure, the plan of the two works is not quite the same. In Mr. MacCallum's book only about a fifth of the space was given to the period before Malory, whereas in the present work the proportion is almost exactly one-half. We believe, for our own part, that Professor Maynadier's plan is the more judicious of the two. The Arthurian legend has a vastly greater importance for mediæval than for modern literature, and, besides, there is really no organic connection between the various treatments of Arthurian story in the different modern periods—between Blackmore's "King Arthur," for example, and Tennyson's "Idylls."

In general, Professor Maynadier's work satisfies all the requirements of exact scholarship, but there are some errors in it which it will be worth while pointing out—most of them, as will be observed, relating to the Old French prose romances, which are so commonly neglected by students of the Arthurian legend on this side of the ocean, owing, doubtless, to the fact that some of the most important of them remain to this day unedited. In the first place, Professor Maynadier invests Malory with an authority which is not his due. Malory has indisputably an important place in the history of English prose style, although to ascribe to him the quality of "swiftness," as Professor Maynardier does, sounds rather ironical; but as far as his materials are concerned, he is entirely unoriginal, and any one who has had to occupy himself much with Malory's relations to his French sources will even begin to doubt whether the merit of judicious selection is really his, and whether the work of compilation and abridgment had not already been done for him, in the main, by some French compiler. However this may be, Professor Maynadier's idea about Malory's Anglicising his material is purely imaginary. The part which the Archbishop of Canterbury plays in the "Morte Darthur" is taken over bodily from the "Mort Artu," or rather the modified form of this romance which Malory undoubtedly followed in the latter part of his work. Similarly, there is no earthly connection between Margaret of Anjou and the story of how Gulnevere defended herself against Mordred in the Tower of London. This story, in every detail, is found in the "Mort Artu," composed more than two hundred years before. In fact the only reason why the "Morte Darthur" has eclipsed the Old French romances is that it is short (comparatively speaking) and they are long. If we take any individual episode in the best of these romances—say, the prose "Tristan" or the "Mort Artu"—we shall find that even in the matter of style Malory enjoys no superiority whatever.

Professor Maynadier makes another slip in regard to Malory's sources, when he cites among them the Middle English stanzaic "Morte Arthur." If he had consulted the Early English Text Society's edition of the poem in question, he would have been saved this error. There are other instances, however, besides those involving Malory, which show Professor Maynadier's imperfect acquaintance with the Old French prose romances. For example, with regard to the continuations of "Merlin" he remarks that, "for some reason or other," the romancers decided to carry the adventures of Merlin beyond Arthur's coronation. But the reason is perfectly well known—namely, a desire to connect "Merlin" with "Lancelot du Lac." Again, our author speaks of the "Quête du St. Graal" as ascribed sometimes to Robert de Boron, but more often to Walter Map, but the versions so ascribed are not identical. The former is preserved in the Portuguese "Demanda do Santo Graall," the latter in the Vulgate—Quest,

published by Dr. Furnivall. Of the story of Mordred's incestuous birth, Professor Maynadier observes: "How this episode got into the stories [of Arthur] cannot be said." It is almost certain, however, as was suggested by Gaston Paris, that this feature of the Arthurian legend was borrowed from the legend of Pope Gregory. Turning to our author's discussion of the Holy Grail, one remarks here again the old error of Alfred Nutt's, which has enjoyed such a vigorous life, concerning "The Lay of the Great Fool"—accepted by that eminent folklorist in his "Legend of the Holy Grail" as a genuine Celtic parallel of the Perceval story. But Professor Zimmer in his review of this book, now seventeen years ago, pointed out that this tale first appears in an eighteenth century Irish manuscript next to a version of Chrétien's "Yvain" and amidst other material of a similar character, so that there can be no reasonable doubt that it too is derived from the French. Professor Maynadier repeats from Paulin Paris a very unfavorable estimate of the compilation of Arthurian romance made by Rusticiano da Pisa in the latter part of the thirteenth century. From the purely literary point of view the judgment may be correct, but this compilation contains Arthurian material of greater value than is generally known, and is one of the first works which should be published, if the longed-for Arthurian Society is ever formed.

There are a good many statements besides the above in Professor Maynadier's work that invite criticism. There is no reason, for instance, for conceiving the historical Arthur as a bare-foot and bare-legged savage chieftain. The Latin origin of his name, which seems well assured—if nothing else—would lead us to suppose that he belonged to the Romanized Celts, and hence was, no doubt, a civilized man. The book, taken as a whole, however, is one of decided value. It is very agreeably written, and has a basis of accurate scholarship.

A Hebrew and English Lexicon of the Old Testament, based on the Lexicon of William Gesenius as Translated by Edward Robinson. By Francis Brown, S. R. Driver, and Charles A. Briggs. Boston: Houghton, Mifflin & Co. $7.50 net.

The title-page of the new Hebrew and English lexicon does not quite accurately describe it. Large as is the debt which it owes to the great German lexicographer, it is really based, not on Robinson's Gesenius, but on an independent and exhaustive collection and analysis of the material, and this alone would suffice to distinguish it as the most important contribution to Hebrew lexicography since the "Thesaurus." When it is added that the gains of three-quarters of a century in Semitic philology, in textual criticism, geographical exploration, and archæological research, as well as in Biblical exegesis, have been brought to bear on the lexical problems of the Old Tstament, it will be understood that the lexicon has no need to commend itself by even the greatest names of former generations. Scholars of the English tongue have now in their hands an instrument not only unsurpassed, but unrivalled in any other language; and American scholars will have a peculiar pride in the fact that it is mainly a product of American scholarship. The publishers and editors, especially Professor Brown, who has borne the burden of the task for nearly twenty years, are to be heartily congratulated in its completion.

Science.

The World Machine. The First Phase: The Cosmic Mechanism. By Carl Snyder. New York: Longmans, Green & Co. $2.50.

Our estimate of this book depends upon what we conceive to be its purpose. If we consider it as the first installment of a new philosophy of the universe, we shall be inclined to criticise it sharply, both for its assumptions and its inadequacies. But if we regard it as a popular history of the development of physical and astronomical science, we must give it praise Apparently the author intends us to take the former view, since he announces two more "phases" in preparation: "The Mechanism of Life" and "The Social Mechanism." He holds that "every step toward positive knowledge has been an advance toward mechanical conceptions of phenomena which must one day end in a *mechanical conception of the whole.*" This sounds as if it were written a generation ago, when it was commonly assumed that the only way to "explain" anything was to construct a model machine which would work similarly, and that if we only knew enough we should see that the universe "really" consisted of nothing but moving atoms. Nowadays the trend of thought is quite the other way. There is a tendency, represented by such leaders as Ostwald and Poincaré, to abandon mechanical analogies as inadequate and cumbersome, even in fields like physics and chemistry, where they have been the most useful in the past. But criticism of Mr. Snyder's mechanical materialism should be postponed until he develops in the later volumes his own system of philosophy.

His point of view does not impair the value of the present volume, because it is the history of the development of the mechanical interpretation of physical phenomena which he has to record. He has given life to this story of ideas by the abundant use of biographical details, dividing it into chapters with such headings as "Archimedes and the First Ideas of Gravitation," "Galileo and the Optic Tube," "Newton and the Motor Force of the World Machine." The conception of history as a series of epoch-making men is at least as legitimate in science as it is in literature, art, or politics, and it is certainly the best way that has been devised for catching the attention of the ordinary reader, for whose benefit the book is written. He will find here what he could elsewhere only by long search, that is, descriptions and explanations in popular language of the most important discoveries in astronomy and physics, and clear presentations of conflicting cosmical theories. Mr. Snyder's style is that of the writer of magazine "feature stories." He picks up picturesque facts and anecdotes and puts them in telling fashion by the free use of slang, snappiness, and grandiloquence. He gets his information mostly at second or third hand and gives few references by which his sources can be traced. Besides the liability to historical errors due to this, he is fond of exaggeration and rash prophecy, such as the following:

> The weather sharp now knows the most, though not all, of the physical conditions which produce the varieties and eccentricities of atmospheric phenomena. The biochemist understands the most, but not all, of the physical conditions which result in the display of life by "inert" matter. But he cannot, as yet, follow these conditions sufficiently close to produce life, just as the weather prophet cannot yet predict earthly weather five hundred years hence, as he will be able not distantly to do. Probably the solution of the one problem will be reached almost as soon as the other.

In "Lilies and Orchids," by Rosina C. Boardman (Robert Grier Cooke), we have handsome reproductions in color of thirty-six drawings of important members of the family of orchids and lilies in the widest sense. The twenty-four plates on which these sketches are grouped are not of equal merit, but all of them are good and not misleading. An objectionable nomenclature is partially atoned for by the use in parentheses of the more generally accepted names. Most of the text is interesting and correct, but there are a few oversights, such as the statement on page 13, "The orchids are more nearly related to the lilies than to any other family": whereas the iris-family and amaryllis-family stand, in every well-considered modern system of classification, as the intermediate steps by which the lilies with their non-adherent ovary have passed into the more highly specialized forms of orchids. All such attractive books as Miss Boardman's are heartily welcomed. We greet with pleasure every treatise on plants and flowers which will lead people to look more closely at their beauty and mechanism, and at what these stand for in the order of nature.

A second edition of Ernest Ingersoll's "The Life of Animals" has been issued with the omission of one illustration, the substitution of several photographs for drawings, and the "correction of a few minor errors." There are still others which should have been corrected, such as the wrong initialing of Professor Osborne's name on page four. It is to be regretted that this opportunity was not taken to introduce a chapter on those important mammals, the cetaceans, which, as in the first edition, are dismissed with a bare half-hundred words.

Dr. Karl Bauer, founder of the observatory at Kalocza, Hungary, and inventor of various meteorological instruments, has just died, in his seventy-sixth year.

Drama and Music.

Stephen Phillips has several plays in hand to follow Mr. Tree's production of "Faust," which he is writing in conjunction with Comyns Carr. He contemplates a new piece for Lewis Waller upon the subject of the Saxon Harold, with the character of Edith designed for Miss Evelyn Millard. He is at work also upon a version of

Victor Hugo's "Le Roi s'amuse," and is writing a one-act play around the character of Jephthah's daughter, which he thinks would suit the personality of Miss Edith Wynne-Matthison.

J. M. Synge's Irish comedy, "The Playboy of the Western World," which created a riot in Dublin, has just been produced in the Great Queen Street Theatre, in London. That it should have given offence in Ireland, does not seem strange. It is a satire, of which the burthen is that in County Mayo the inhabitants would make a hero of a man who had killed his father, merely because he had the pluck to kill him out in the open with a "loy," or potato-spade, not from behind with a rusty fork, as the Widow Quin killed her husband. It is said in construction, character, and dialogue, to be the best play Mr. Synge has yet written; and its setting, its incidents, and its treatment are so unfamiliar as to double its value in the eyes of English theatregoers.

A dispatch announces the death on Monday of Joseph Knight, the oldest of London's dramatic critics. He was born in 1829. He was an excellent Shakespearean scholar, and his criticisms in the *Athenæum* were marked by good judgment and commendable reserve. Since 1883 he had been the editor of *Notes and Queries*, and in addition to his connection with the *Athenæum*, as dramatic critic, he wrote the criticisms for the *Globe*. As a writer of books Mr. Knight was also well known. He prepared a life of Dante Gabriel Rossetti for the Great Writers Series (1877), and was the author of "Theatrical Notes" (1893), "Life of David Garrick" (1894), "The Stage in the Year 1900" (1901), and the lives of actors for the Dictionary of National Biography. He was also the editor of Downe's Roscius Anglicanus.

Mr. Kneisel, who declined the directorship of the Philadelphia Orchestra in order to continue with his Quartet, has gone abroad to search for a violoncellist to replace Mr. Schroeder. With him he will then go to his place at Blue Hill, Me., to rehearse the quartets to be played next season. Of the amount of painstaking and repetition required to secure an exquisite ensemble like that of the Kneisel Quartet, few music-lovers have the remotest idea. The players also have to deny themselves many forms of exercise which would delight and invigorate them. They cannot row, nor can they ride a horse. Mr. Kneisel has a garden, but he cannot use the spade or the hoe. "A violinist," he said the other day, "should not even carry an umbrella or a cane. Whenever I do so I have cause to regret it, for it mars the smoothness of my bowing. Ysaye has had the same experience. Sarasate used to leave his house for a walk with a stick in hand, but after a short distance he always gave it to his valet." One reason why Mr. Kneisel likes the Maine coast is that at his summer residence the strings behave so much better than further south; a dozen strings last as long there as a hundred do near Boston; and the presence of fog in Maine does not alter that fact.

The German Brahms Society has just issued Ellen's Second Song, by Schubert (opus 52, No. 2), arranged by Brahms for soprano solo, female choir, and wind instruments. The Brahmsgesellschaft has also issued a new edition of "Brahms-Texte," containing all the poems he set to music, and of the first volume of Max Kalbeck's elaborate biography of Brahms. The second volume is to appear in the autumn. A new edition is also promised of Brahms's correspondence with Heinrich and Elizabeth Herzogenberg, in which, however, Brahms plays a minor rôle, his own letters being few in number and uninteresting.

A Leipzig firm has sold the MS. of one of Beethoven's sonatas for piano and violin (in G-major, opus 96) to Commendatore Leo S. Olschi of Florence, for $10,000 (42,500 marks). A good deal of soreness has been caused among the Germans by this sale.

Vladimir De Pachman, the great pianist, announces his farewell tour in America from September, 1907, to May, 1908.

The death is announced of H. A. Köstlin, professor of theology in the University of Giessen from 1895 to 1901. He was the author of several important works on the history of church music.

Art.

Some important changes are being made in the hanging of the pictures at the Louvre, which, in the case of Rembrandt, are distinctly for the better. The tendency of late in exhibitions of old and modern painters is to place the work of one man together, and this is the arrangement now adopted with the Louvre Rembrandts. They have been brought from the Salon Carré and the little alcoves and grouped at one end of the long gallery. It is a regret, of course, not to find that wonderful Hendrickje Stoffels in the Salon Carré with the Lionardo and the Giorgione, the Velasquez and the Titians. But there is no doubt that Rembrandt never before has been so well seen at the Louvre; many bare spaces are left on the walls of the alcoves, and probably there will be further interesting groupings and changes before long. One other thing that strikes the present visitor at the Louvre is the positive splendor with which Manet holds his own in the great room of the modern Frenchmen. Ingres, from whom it can now be seen how much he learned, pales before the beauty and the colors of the Olympe. The picture seems to have gained by the removal from its probation at the Luxembourg to a place among the masters.

There have been changes also in the hanging at the London National Gallery, and these also are very much for the better. The influence of Sir Charles Holroyd is already making itself felt, though it is hardly a year since he succeeded Sir Edward Poynter, and the few things he has had time to do make one hopeful for the future of the Gallery under his direction. The most notable change as yet is in the arrangement of the Dutch and Flemish pictures. The large room where they have hitherto hung together is now reserved for the Dutchmen, and Franz Hals has his place, as he should, on the walls with Rembrandt. The Flemish pictures fare no less well. Rubens, in a room apart, which he almost fills, the remaining space being given to Jordaens and Van Dyck, has a stateliness and sumptuousness that never impressed one in the same way when his three or four big pictures were in the corner of the large room. They appear now with the decorative dignity that belongs to them, while the student profits immensely by the new arrangement. Here, too, bare spaces on the walls prepare one for further changes. It is noticeable that modern foreign work has been gradually creeping into the National Gallery of late. There are the Boudin and Fantin with the French collection, and a little group of modern Dutchmen, with the old Dutch masters. The latter group has been lent—not bought or presented. And it must be said that the work scarcely has the distinction that justifies the acceptance of the loan at Trafalgar Square, where there is a modern section only for British work, and even this the Tate Gallery is rapidly monopolizing.

The exhibition of the New English Art Club is now open in London; its present headquarters an unattractive little gallery in Dering Yard, just off New Bond Street. There was a time when this exhibition was one of the most interesting given in England. The club was young; so were its members, who represented all that was strongest and most promising in the art of Great Britain. You could smell the powder, feel the revolution in the air at their annual show, the enthusiast used to say. But the club has reached the conservatism of maturity, it has managed to get rid of many of its distinguished and promising members, and to-day it is little more than a gathering of the professors of the Slade School at University College, their friends and followers. Wilson Steer remains, and he, by refusing to exhibit with other societies or academics, has proved a very decided attraction. But his two pictures this year—portraits—show that he is now wavering in his allegiance between the French and English portrait-painters of the eighteenth century, as in his landscapes he has so often wavered between Monet and Constable. Walter Sickert remains, but, apparently, prefers to reserve his best work for other galleries; worthier things of his have been seen at the new Salon in Paris, and the International in London. Rothenstein remains, but seems, in paint, to be endeavoring to rival Mr. Zangwill's success in words, and, in his presentation of his people at their religious rites, to be looking to subject for success as dutifully as any Academician; the Ghetto supplying the novelty. The younger members, who have come into the fold of late, have not done much so far except to express unquestioned loyalty to Slade teaching, or to give that promise which, at the New English Art Club, has for the last twenty years passed as achievement. The result is that the present exhibition would be sadly dull and disappointing, but for the contributions of an Academician, Mr. Sargent. For some reason he has always been honored by the club, and he often shows with its members. He has now several brilliant sketches, mostly of architecture, in oils and water-colors, which, by their vigor, their audacity, their solidity, emphasize the weakness of the work sur-

rounding them. Here, anyway, is a man who can make good, strong studies, but does not think art begins and ends with the jotting down, on paper or canvas or metal, of his notes and memoranda. The New Englishman, as a rule, leaves off where the artist begins, and is coutent to display the study for the masterpiece that is never done—often not even attempted. The pity of it is that the club at the start had everything in its hands, and could have become, had it continued on the same lines, a formidable opponent to the Academy. Now it has left the work of opposition to the International, and one can only hope that the efficiency of this society in the work of reform will be more enduring.

The frontispiece of the *Burlington Magazine* for June is a photogravure after "A Man with a Hawk," by Henry Wyatt, an almost unknown English painter of the early part of the nineteenth century, who worked as an assistant in the studio of Sir Thomas Lawrence and is, likely enough, the real author of many pictures attributed to his master. The work has sufficient quality to make one feel that the individuality of the painter is worth rescuing, but, at least in the reproduction, hardly enough to justify the praise of the writer in the *Burlington*, who says of it:

Here we have a picture which in spirit and accomplishment is of the highest degree of excellence, and only falls short of the work of the supreme masters of portraiture from lack of the gravity with which they invest their sitters.

After this there is something of anticlimax in the further statement that "but for the inscription on the back of the eanvas, the painting might well have passed for the work of Lawrence." An article by Perey Moore Turner on "The Representation of the British School in the Louvre" gives occasion for the reproduction of two pictures by Lawrence himself, that extremely clever painter who was so far from a "supreme master," and of Reynolds's Master Hare, accidentally mislabelled "by T. Gainsborough." The leading article is Ethel Ross Barker's account of "Past Excavations of Herculaneum," illustrated with five plates after antique bronzes, and there are articles on tapestry, stained glass, Dutch and Flemish furniture, etc., etc. The department of Art in America is largely devoted to notes on the exhibition of the National Academy, that of the Ten American Painters, and several minor exhibitions.

The special spring number of the *Studio* is devoted this year to the Royal Scottish Academy, and contains a history of that institution by A. L. Baldry, lists of its members and professors, forty plates in color after the works of prominent members, past and present, eight portraits and four facsimiles of autograph letters. The Scotch painters have evidently confined their efforts largely to landscape and portraiture, and there are few serious attempts at figure painting in these forty plates. In landscape the earlier work is scenic, the later episodical and *intime;* but through the whole series, from the pictures of the earliest Academicians to those of the Glasgow men of to-day, there is an obvious attempt at fulness and quality of color which distinguishes these men from their contemporaries over the border, and justifies, to some extent—in spite of the evidenecs of foreign influence, particularly that of the modern Dutch School, in the more recent work—the contention that there is a Scottish School of painting.

The Life Publishing Co. puts out a handsomely printed quarto, with pictures and verse from that weekly, with the appropriate title of "The Comedy of Life." The drawing of these cartoons is sometimes a little to seek, but their wit and grace and their skill in characterization rarely fail.

The Prix Henner, of 3,000 fr., for a figure painter of French nationality, and at least thirty years old, has been awarded for the first time by the Société des Artistes Français to M. Guinier, who exhibits two paintings, Femme Pensive, and Jeune Fille et Pavots.

Léon Gauchez ("Paul Lervi") has died in Paris in his eighty-third year. M. Gauchez was founder and director of *L'Art*.

Finance.

CAUSES OF THE "BETTER FEELING."

It has been manifest this past week, to every one accustomed to feel the pulse of financial sentiment and financial markets, that a distinctly more hopeful feeling has begun to prevail. This has been noticeable, not through predictions of a "boom in trade" or a "boom in stocks," but through the gradual disappearance of the pessimism which, a very few weeks ago, tinged every expert diagnosis and prognosis in finance. Until this change in sentiment occurred, belief was general that a season of grave disturbance was before us in the summer, and that serious complications, financial or industrial, were possibly yet to be undergone. By no means every experienced watcher even yet declares that the markets will not have to sail through troubled waters between now and the later autumn. But a feeling that the financial position is now such that trials of this sort may be endured without disaster, if not without inconvenieuce, has grown very general.

What has caused the change? The Stock Exchange, which measures everything in the terms of professional speculation, replies that "liquidation has been completed," and that the market is "sold to a standstill." This is not so trivial a view of the case as may perhaps be imagined; for the Stock Exchange is a microcosm in which all the forces at work in outside finance and industry are embodied, and when urgent sales of investment securities have ceased, the usual meaning is that the financial or industrial distress from which those sales resulted has also come to an end, or has, at all events, reached a stage where there is promise of relief. But this does not answer the main question. Why should even this compulsory or precautionary throwing over of investment holdings have ceased?

The eause may be either technical or sentimental—that is to say, the sales may have stopped because those already made had provided the capital requisite for safety, or because the fears which provoked the previous selling had been removed. As regards the first of the two suppositions, it must always be true that, at some point, realizing on their investment holdings will put embarrassed individuals or companies into a position of safety. Their difficulty was, that they could not borrow; but by thus marketing part of their possessions, they may dispense with borrowing, and pay off debts. Such a result assumes a demand from purchasers on the Stock Exchange which will produce the requisite sum. Lacking such demand, prices might fall to ruinous figures—as they do, precisely because of paralyzed purchasing power, in a real industrial panic. Nothing like that has resulted this past season; the lower prices fell, the stronger became the legitimate demand for them. It was evident that, at a price, capital could be had, and the low valuations fixed on the Stock Exchange in March and May were the price exacted and paid.

Nor is this all of the technical relief provided. In a genuine panic, prices for stocks may be so disordered that banks, themselves embarrassed from other reasons—say from a run of depositors—are more reluctant to lend on such security than they were at the higher level. The result then is a frantic bid for money by Wall Street, and

Financial.

Convertible Bonds

In the third edition of our 6-page circular, entitled "Convertible Bonds," we describe practically all of such investments now upon the market. In addition, we explain why such bonds, when properly selected, are well regarded by conservative investors, and also why they possess every probability of returning exceptionally large profits.

Properly selected investments are based upon safety and income yield combined; in other words, minimum risk of principal and maximum income return.

failure of firms which cannot get it. Nothing like this has resulted from the past season's fall in prices; on the contrary, Stock Exchange liquidation released so many bank loans, and fall in Stock Exchange prices reduced so largely Wall Street's demands on bank resources, that people with good securities to offer as collateral found the money rate suddenly reduced to the lowest figure in months. This of itself may have averted further forced liquidation.

So much for the technical side. It will readily be perceived, however, that the very fact which made possible this restored equilibrium was the absence of general fright and panic; therefore the sentimental causes of the better feeling may, after all, turn out to be fundamental. Dozens of reasons are usually offered to explain such a change in financial sentiment, and, naturally, the number produced after the event is larger than those assigned in prediction. One influence towards better feeling stands out, however, so distinctly, and with so logical a bearing on the financial situation, that it may fairly be called paramount. This influence is the altered outlook for the harvests. That the season of growing crops, both in this country and in Europe, began unfavorably, is known to every one. That the agricultural situation was highly critical up to the opening of June, was witnessed by the violent advance in grain prices. The first of June, in the Eastern States, was the coldest June day on the Weather Bureau's records, and it was freely asserted, at that time, that nothing could save the harvests from a possibly disastrous shortage, except "perfect weather" from that time forward.

This was a hard requirement; yet, in the three weeks which have ensued, precisely that ideal "growing weather"—hotter than usual, which was to be desired after the abnormal cold of May—has prevailed throughout the United States. Wheat and cotton prices have fallen; it is now confidently expected that the Government's July cotton crop estimate, due next Wednesday, and its grain crop estimate, due Wednesday of the ensuing week, will show very great improvement in the outlook. For wheat, at any rate, the prospect of the moment is for a yield large enough—when added to a surplus, from last year's crop, 48,000 000 bushels greater than the "carried-over" surplus a year ago—to spare the usual amount for export. With Europe's harvest shortage from last year's yield now calculated at 180,000,000 to 280 000,000 bushels, the financial importance of this change in our own situation is enough of itself to explain the change in sentiment.

No single cause ever operates alone in a matter of this sort; financial movements result from the cumulative influence of a great variety of causes. Therefore it is easily possible that the failure as yet of any formidable trade reaction to develop—entailing such consequences as did the iron trade relapse of 1903—is a strong contributing influence towards better feeling. The nearness of the "July reinvestment period" always has some effect, and may have more than usual this year, when the mid-year revenues will be used quite as much to liquidate over-extended credit as to invest on the Stock Exchange. No doubt it will be alleged, by that curiously perverse part of the railway community which has insisted on "antagonism to railroads" as the root of all recent depression, that people are growing reassured in that direction, and are therefore feeling better. This argument meets difficulties, unless President Roosevelt's rather Delphic Memorial Day speech, or Gov. Hughes's veto of the "Two-Cent Fare bill" in New York, is assumed to mean reversal of public opinion. However, such things are undoubtedly a help, even if their function as the main cause of conditions precedent is not admitted.

The larger question is, whether the favorable change in financial sentiment is merely a temporary incident, or marks the real turn in the tide. As to that, one must watch three doubtful spots in the situation. Crops may be growing well into July, or even into August, yet be blighted at harvest, and late crops, like this year's, run a peculiar risk. The bank position is not as strong as might be wished, when the New York surplus reserve, at $5,600,000 last Saturday, was the lowest on record for that date, outside of the panic year 1893, and when $6,000,000 gold per week has lately been going from New York to Europe. Finally, the world outside of the United States is not in the best financial position, when financial trouble has actually broken out at Genoa, Alexandria, and Rio Janeiro, and when London and Paris are facing formidable liquidation. But these are considerations for the future.
